## Unrivalled Support for Standards

ESRI continues to advocate the need for open access to geographic data and functionality through support for widely adopted and practical standards. This document presents an overview of ESRI's supported standards.

The ArcGIS platform is designed and engineered with interoperability in mind and conforms to the open standards that are necessary to implement enterprise systems. Users can incorporate GIS in any application, on a variety of computing and mobile devices, and use geographic information in almost any format, accessed from databases or delivered as Web services.

This enables defense and intelligence organizations to implement ArcGIS in a service oriented architecture as a horizontal, cross-cutting spatial information and application infrastructure. System integrators and other developers can implement capabilities on this infrastructure by using the open programming interfaces of the ArcGIS platform.

This table lists standards and interoperability protocols that ESRI supports in its range of software products. It divides the standards into three domains: information technology (IT); defense & intelligence; and geospatial standards.

This is a sample of standards supported by ESRI; not all standards, formats, and protocols are listed. Read more about ESRI's commitments to standards and interoperability at [www.esri.com/standards](http://www.esri.com/standards).
