**Source:** U.S. Census 2018-2022 American Community Survey. **Data Note:** N/A means not available. Ratio of Income to Poverty Level represents persons for whom poverty status is determined. Household income represents income in 2022, adjusted for inflation.

**Margin of error (MOE):** The MOE is a measure of the variability of the estimate due to sampling error. MOEs enable the data user to measure the range of uncertainty for each estimate with 90 percent confidence. The range of uncertainty is called the confidence interval, and it is calculated by taking the estimate +/- the MOE. For example, if the ACS reports an estimate of 100 with an MOE of +/- 20, then you can be 90 percent certain the value for the whole population falls between 80 and 120.

**Reliability:** Symbols represent threshold values Esri has established from the Coefficients of Variation (CV) to designate the usability of the estimates. The CV measures the amount of sampling error relative to the size of the estimate, expressed as a percentage.

- High Reliability: Small CVs (less than or equal to 12 percent) are flagged green and are considered reasonably reliable.
- Medium Reliability: Estimates with CVs between 12 and 40 are flagged yellow and should be used with caution.
- Low Reliability: Large CVs (over 40 percent) are flagged red and are considered very unreliable.
