

# Conflation Tools and Workflows: An Introduction

Dan Lee

(dlee@esri.com)

SEE  
WHAT  
OTHERS  
CAN'T

# Agenda

## Introduction

- **Multi-source data issues**
- **Geoprocessing conflation tools**

## Conflation Workflows

- **Automatic and interactive processes**
- **Demo on Transfer Attributes workflow**

## User Stories and Future Work

# Introduction

# Inconsistent multi-source data and common needs

## For overlapping datasets:

- Find spatial and attribute changes through feature matching
- Reconcile the differences

## For adjacent datasets:

- Resolve disconnections and conflicts in bordering areas

## Ultimate goal:

- Maintain a unified and seamless dataset for reliable analysis and quality mapping

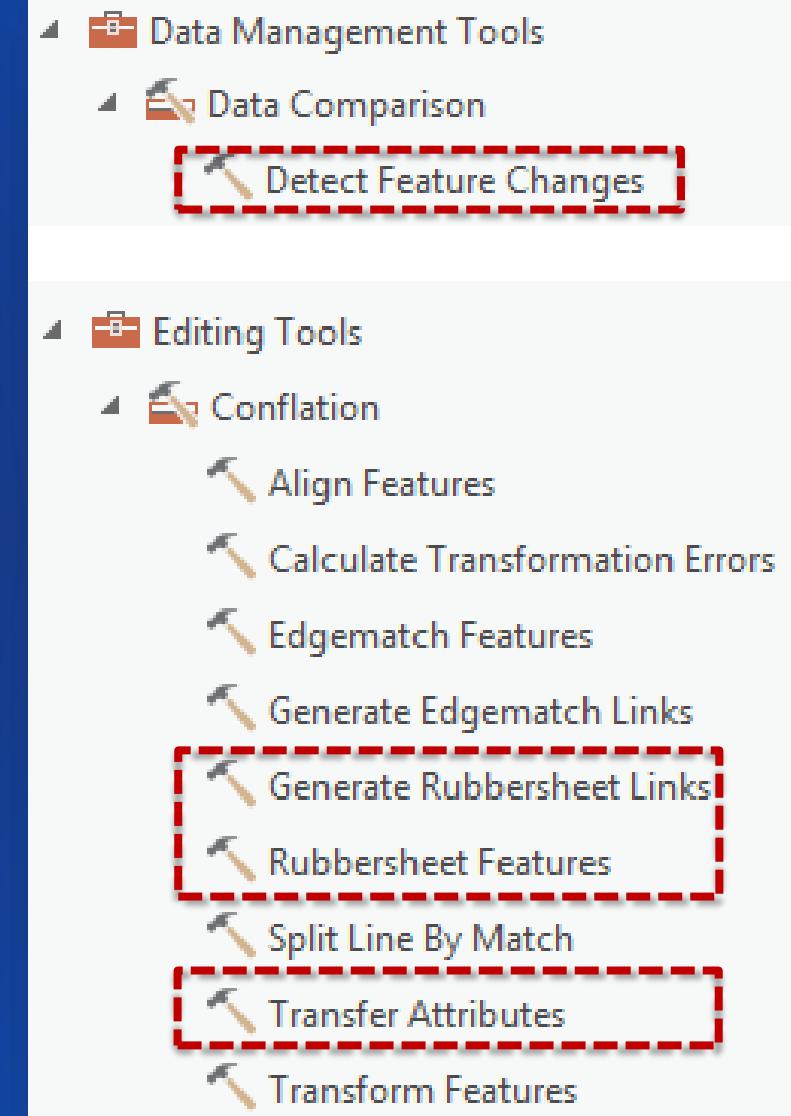

# Conflation tools in geoprocessing

## System tools for overlapping datasets

- Focus on common use cases
- Aim at high matching accuracy (not promising 100%)
- Provide information to facilitate post-review and edit

## Supplemental workflow tools

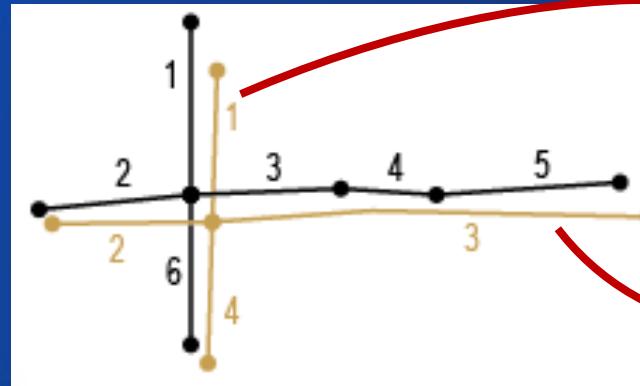

In ArcGIS Pro 2.4 and 10.7.1

# Feature matching (FM) for overlapping datasets

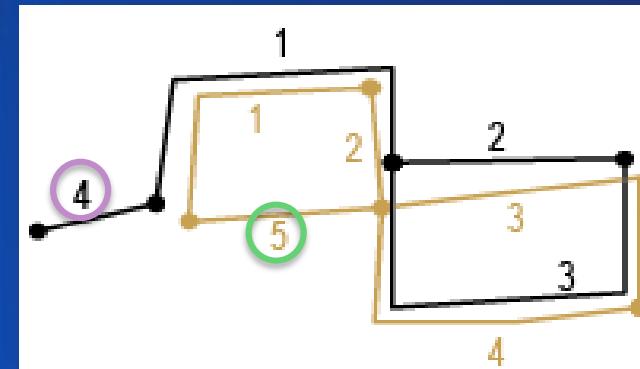

Based on proximity, topology, pattern, and similarity analysis, as well as attributes information

- Source feature
- Target feature

**1:1 and 1:m matches**

OBJECTID *	SRC_FID	TGT_FID	FM_GRP	FM_MN	FM_CONF
1	1	1	1	1:1	100
2	2	2	2	1:1	100
3	3	3	3	1:3	100
4	3	4	3	1:3	100
5	3	5	3	1:3	100
6	4	6	4	1:1	100

**m:1 and m:n matches**

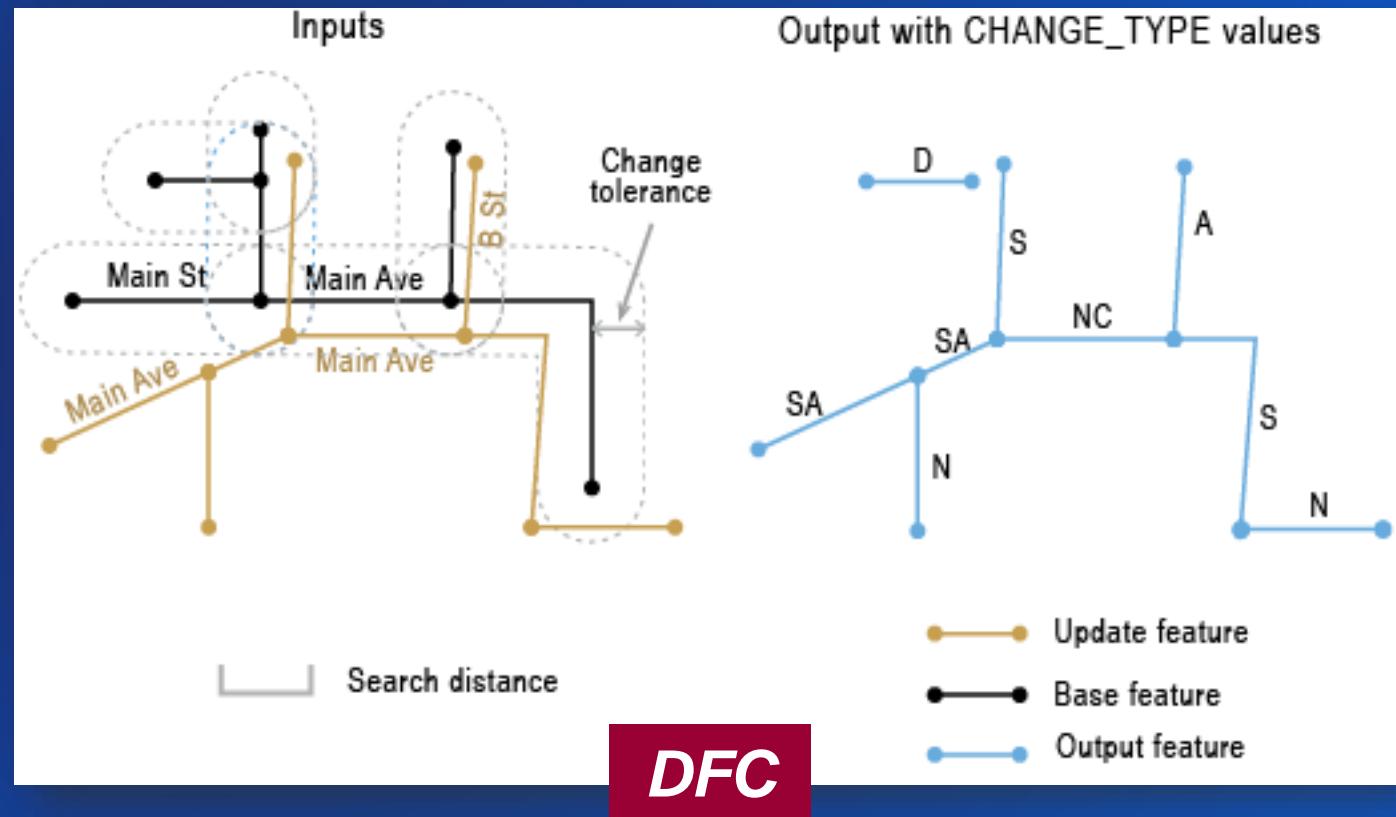

OBJECTID *	SRC_FID	TGT_FID	FM_GRP	FM_MN	FM_CONF
1	1	1	1	2:1	100
2	2	1	1	2:1	100
3	3	2	2	2:2	100
4	3	3	2	2:2	100
5	4	2	2	2:2	100
6	4	3	2	2:2	100
7	5	-1	-1	N/A	0
8	-1	4	-1	N/A	0

# FM-based tool #1 - Detect Feature Changes (DFC)

Finds and reports feature differences

## Output CHANGE\_TYPE

- Spatial change (S)
- Attribute change (A)
- Spatial & attribute change (SA)
- Spatial and line direction change (S\_LD)
- Spatial, attribute, and line direction change (SA\_LD)
- No change (NC)
- Unmatched update feature (N)
- Unmatched base feature (D)

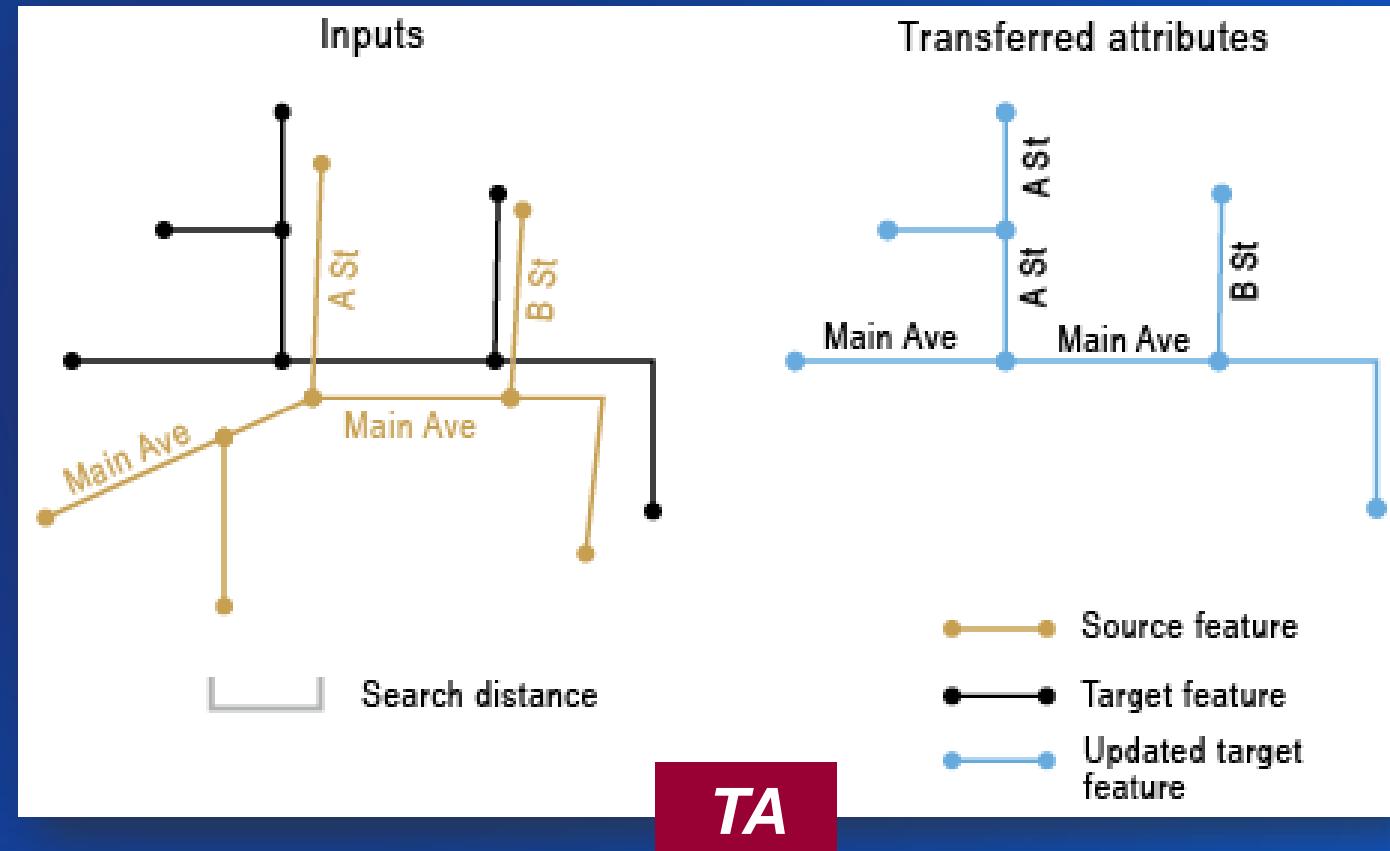

# FM-based tool #2 – Transfer Attributes (TA)

Transfers attributes from source to target features

**Target features are modified**

- Transfer fields (e.g. ROAD\_NAME, UniqueID) are added
- Optional transfer rules for m:n matches can be specified

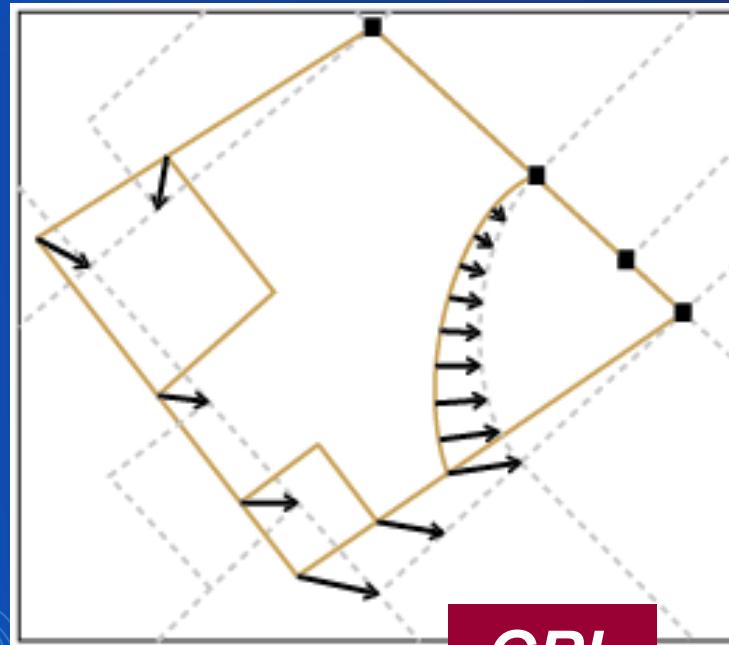

# FM-based tool #3 – Generate Rubbersheet Links (GRL)

Derives links from source to corresponding target locations for rubbersheeting adjustment

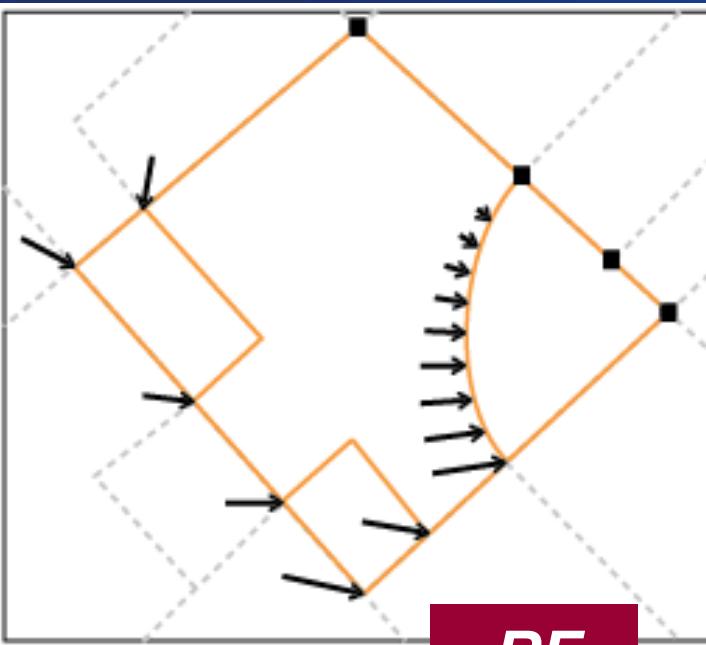

## Generate Rubbersheet Links (GRL)

- Regular links and identity links

## Followed by Rubbersheet Features (RF)

- Adjusting input features to target locations

- Search distance
- Input feature
- Line as regular rubbersheet link
- Point as identity rubbersheet link
- Adjusted feature
- - - Target feature as reference

# Conflation Workflows

# Typical processes

- **Consistent projection**
- **Data validation**
- **Selection of relevant features**

- **Conflation tools**
- **Workflow tools**

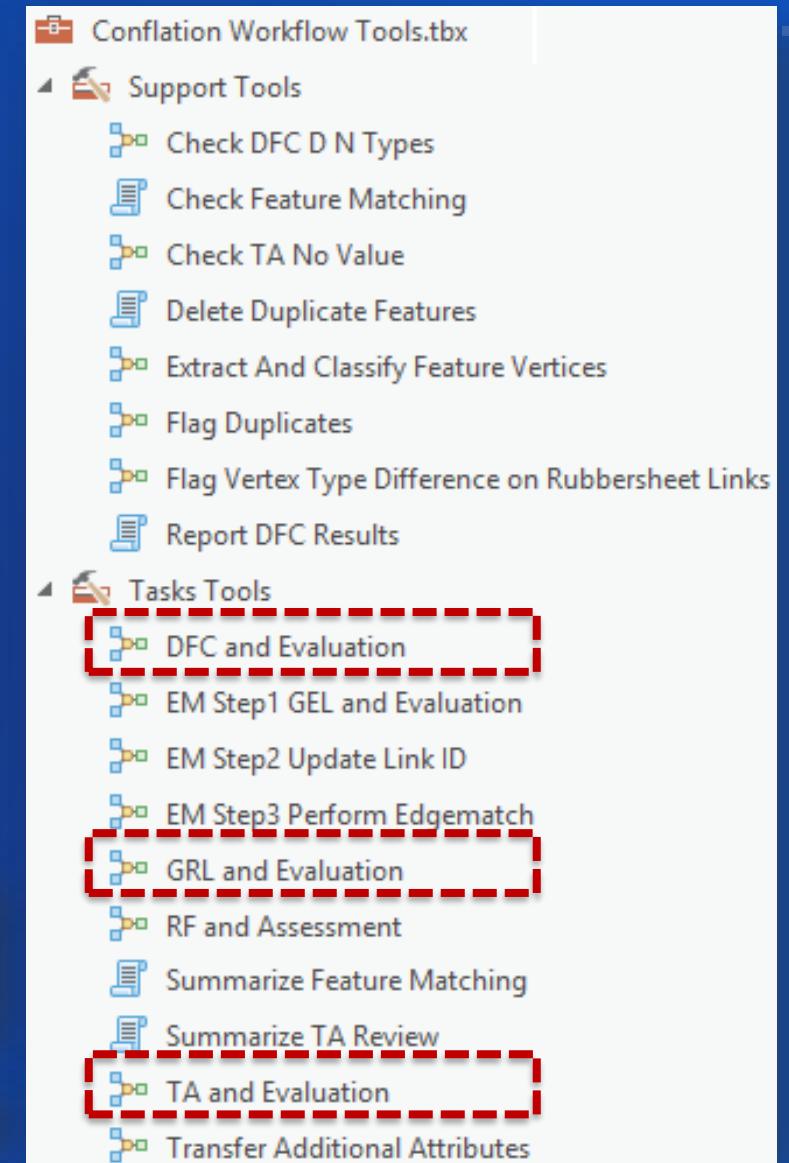

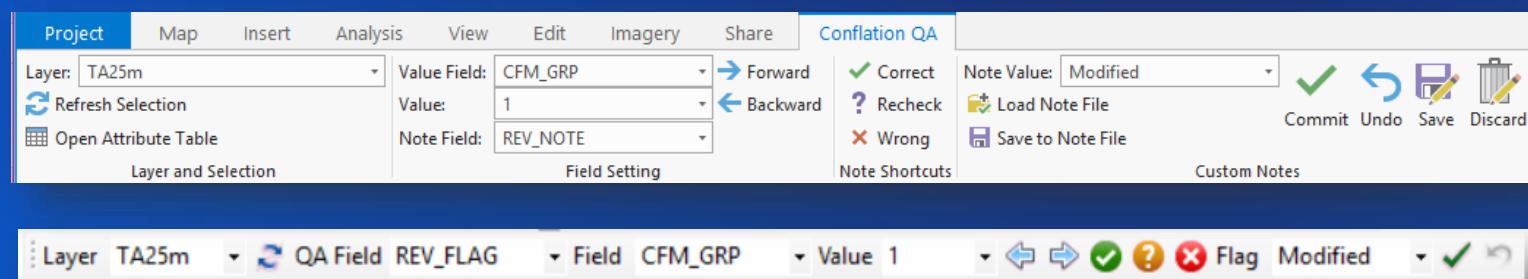

- **Interactive review and edit**

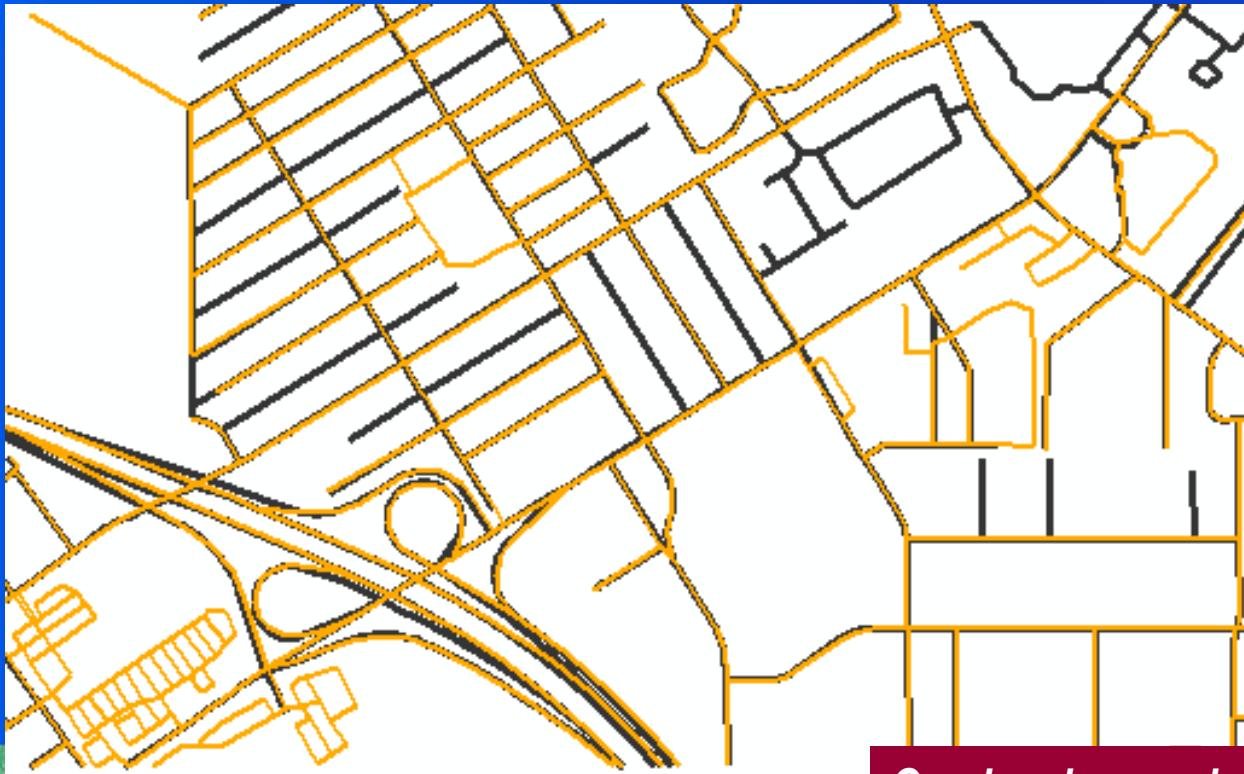

# Supplemental Workflow Tools

## Focusing on popular tasks:

- Each task involves system tool + Evaluation
- Potential issues are flagged in the output
- Review is done interactively using Conflation QA tools (SDK add-in for Pro; python add-in for ArcMap)

Let's take TA workflow as an example ...

## Transfer Attributes workflow (demo)

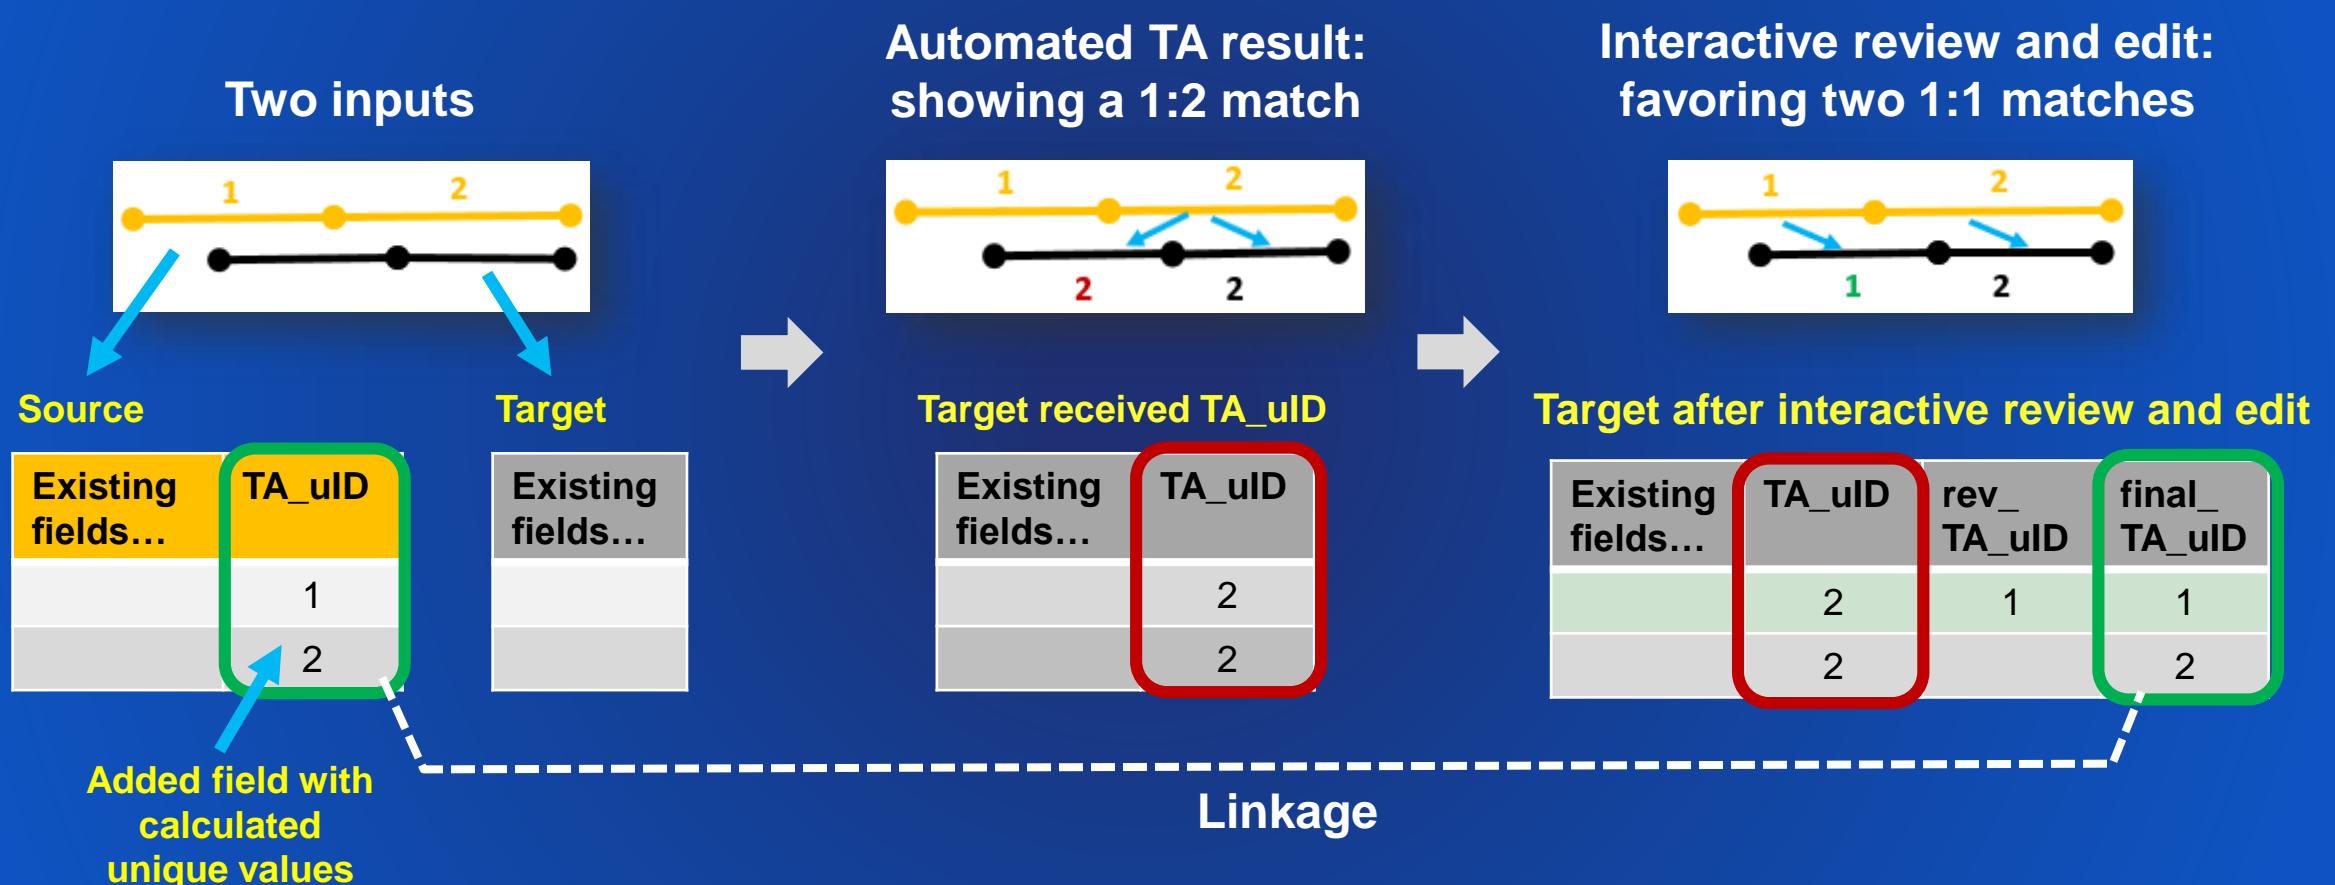

- Using linkage strategy

# Linkage

- Common field values for corresponding source and target features
- Key for transferring additional attributes
- Can be established using Transfer Attributes workflow

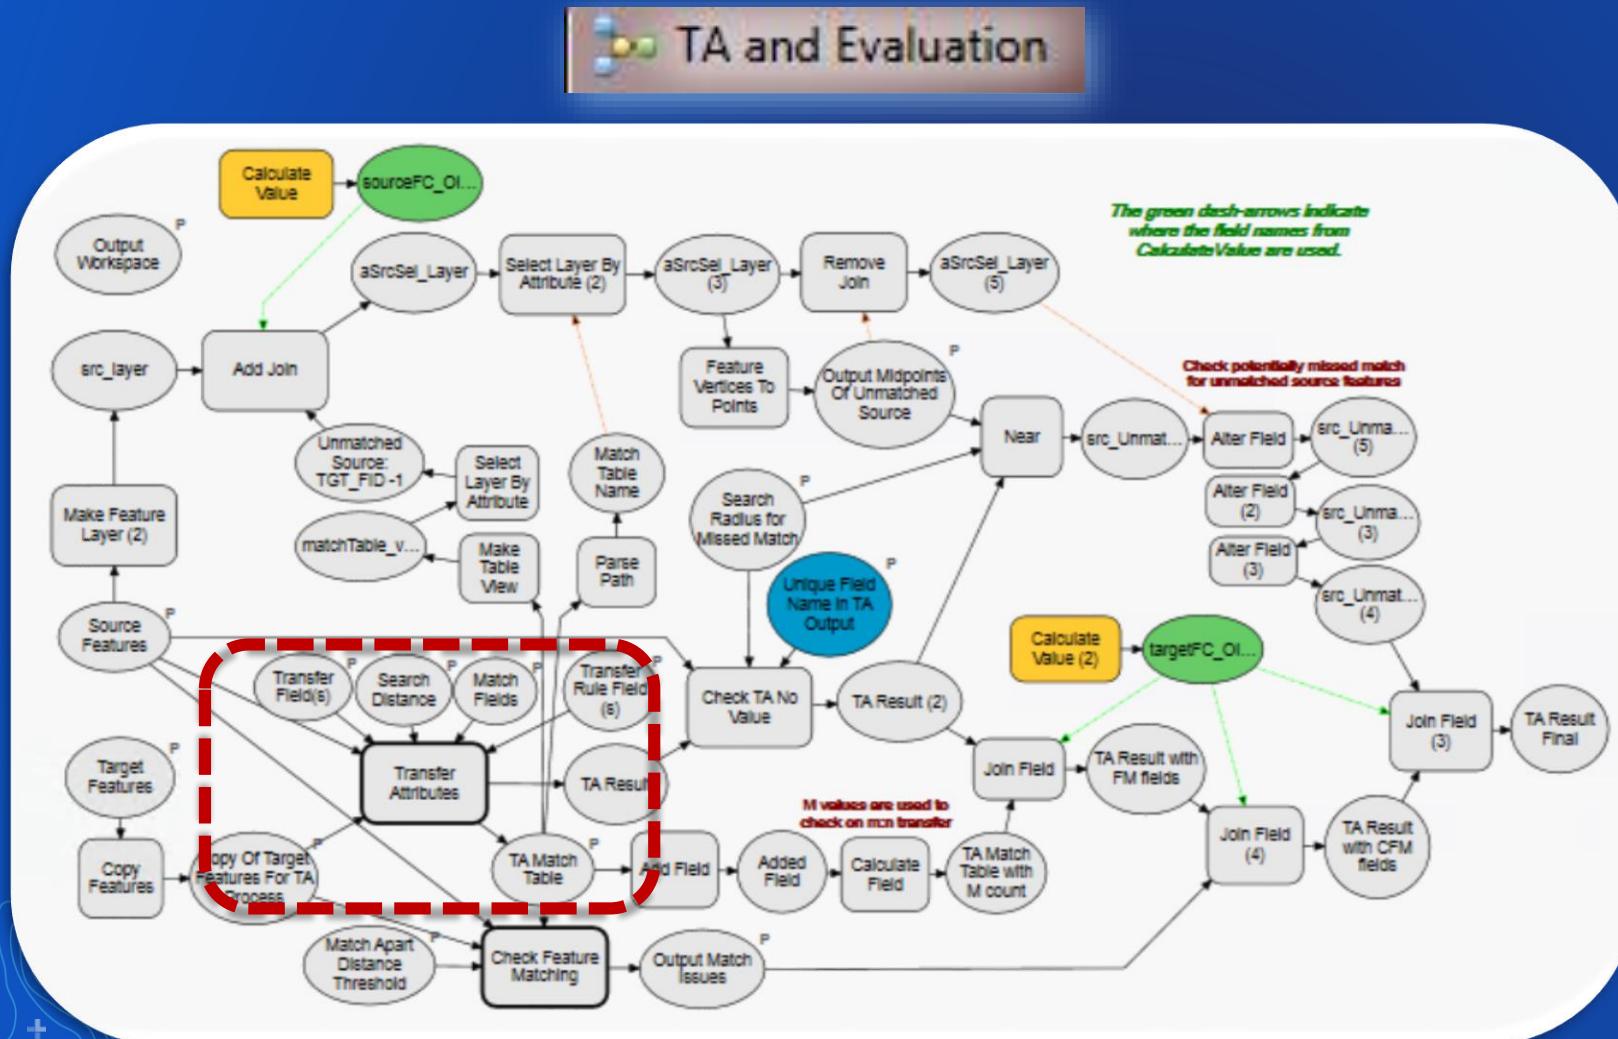

# Establishing linkage for matching features

# Automated TA and Evaluation

**TA\_uID is transferred; potential issues are flagged for review**

# Attribute transfer accuracy estimates

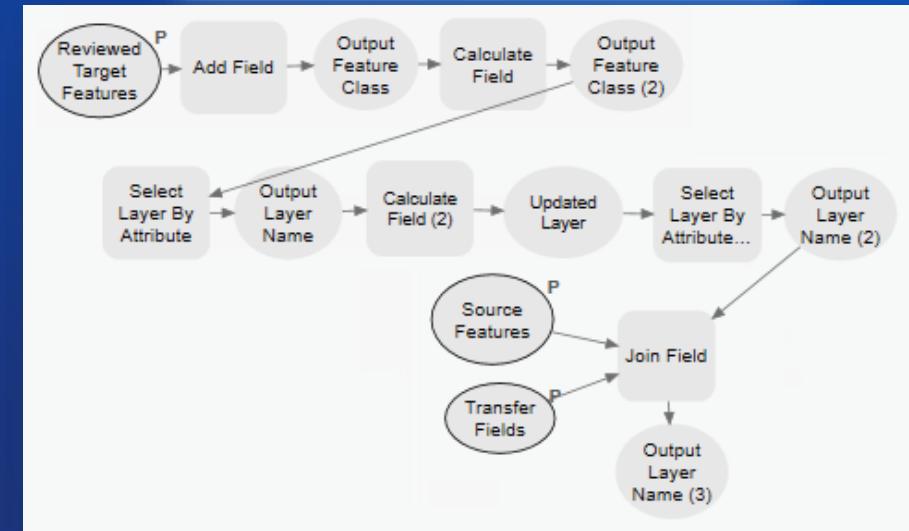

- Total target features: 1128
- Incorrect: 12
- Correct: 1116

$$\text{Accuracy} = 1116 / 1128 \Rightarrow 98.9\%$$

- Remaining no transfer features (TA\_uID IS NULL AND REV\_FLAG IS NULL): 80  
*All correct*

# Post transfer if necessary

## Transfer Additional Attributes

## Merge TA result with edits

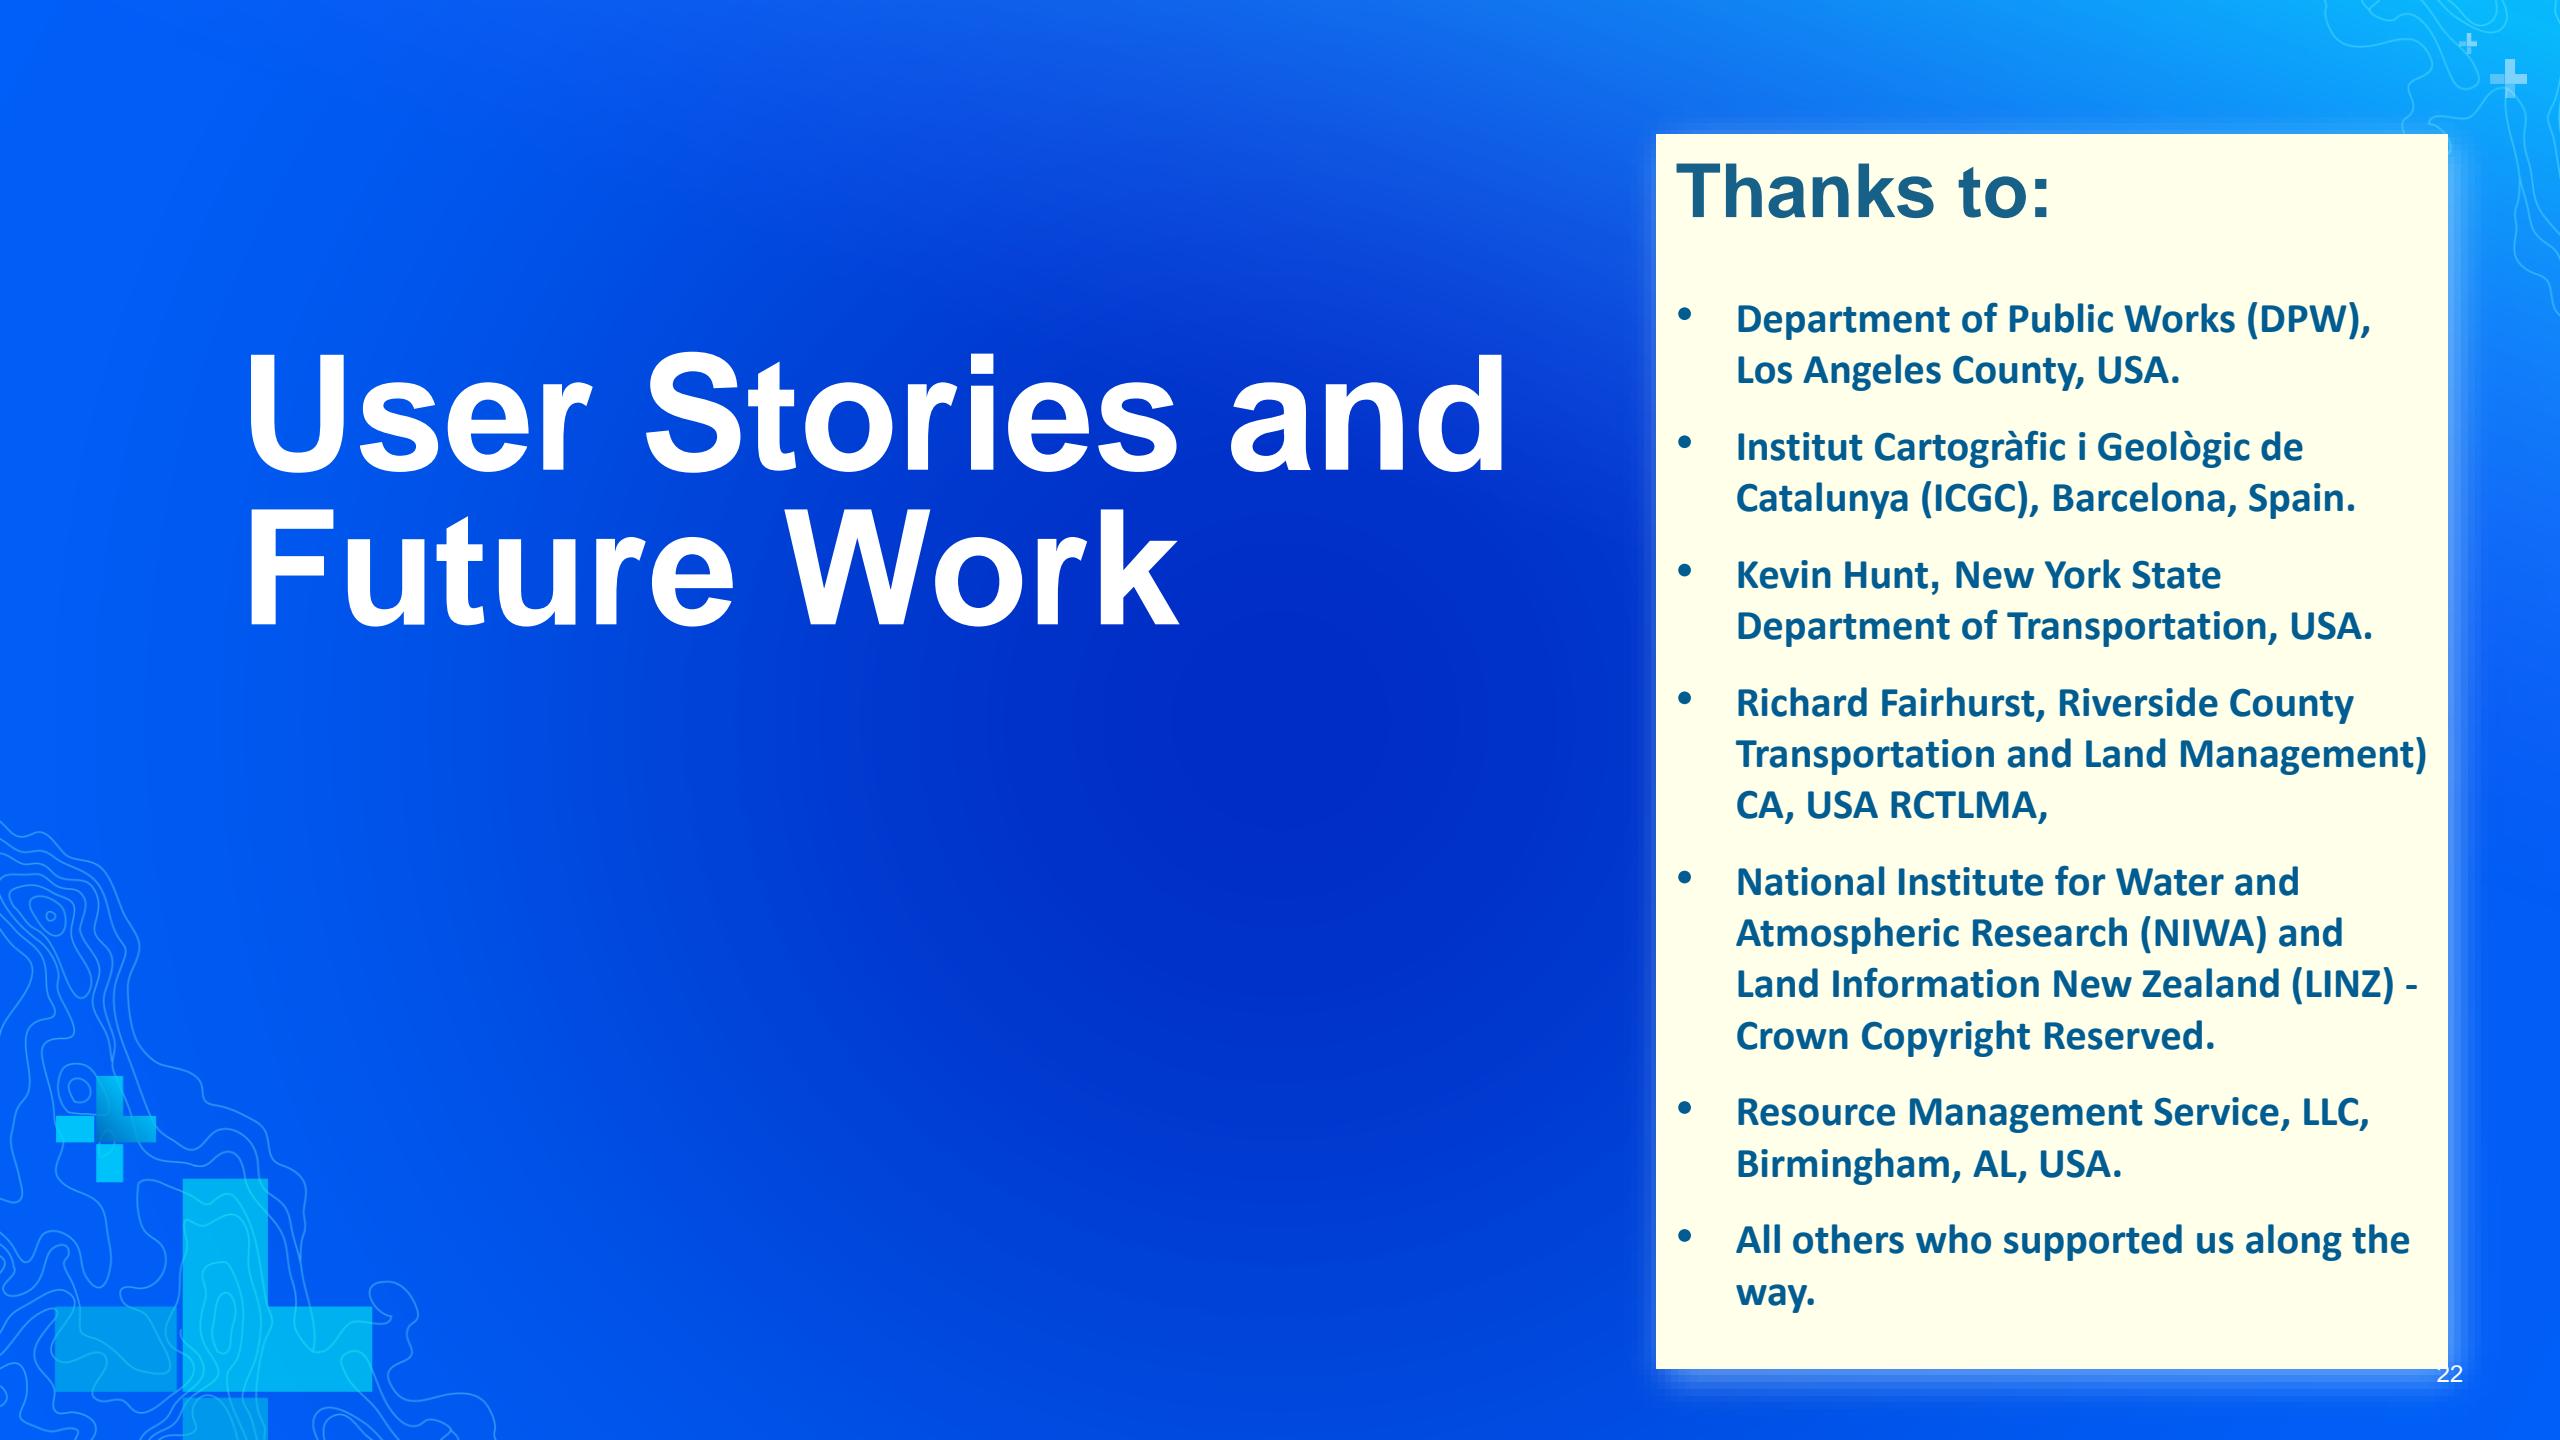

- Add a field **final\_TA\_uID** and Calculate **final\_TA\_uID = TA\_uID**
- Select **REV\_NOTE = 'Wrong'** and calculate **final\_TA\_uID = rev\_TA\_uID**

## Transfer additional attributes via Join Field

- The common fields are: source **TA\_uID** and target **final\_TA\_uID**

The screenshot shows a Microsoft Excel spreadsheet with a table of data. The columns are labeled as follows: OBJECTID, TA\_uID, NEAR\_FID, NEAR\_DIST, FM\_GRP, FM\_MN, srcM\_inMN, CFM\_GRP, CFM\_FLAG, CFM\_DIST, srcORIGID, srcNearID, srcNearDist, REV\_NOTE, rev\_TA\_uID, final\_TA\_uID, and name. Red arrows point to the TA\_uID, final\_TA\_uID, and name columns. The data includes various street names and their attributes, with some entries having REV\_NOTE set to 'Wrong'.

OBJECTID	TA_uID	NEAR_FID	NEAR_DIST	FM_GRP	FM_MN	srcM_inMN	CFM_GRP	CFM_FLAG	CFM_DIST	srcORIGID	srcNearID	srcNearDist	REV_NOTE	rev_TA_uID	final_TA_uID	name

# User Stories and Future Work

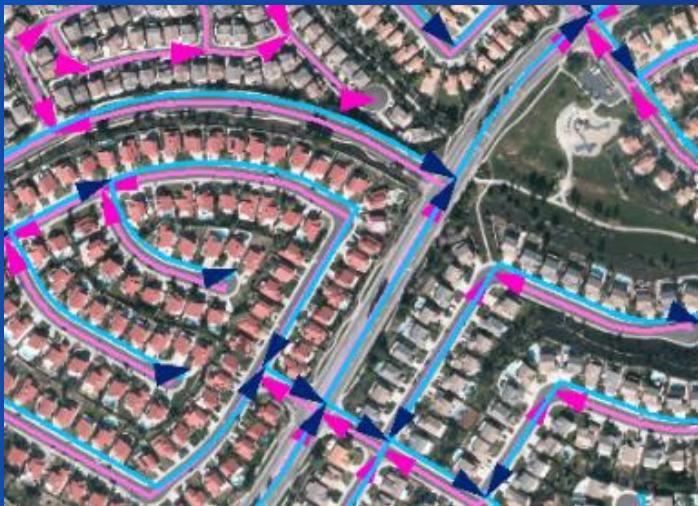

## Thanks to:

- Department of Public Works (DPW), Los Angeles County, USA.
- Institut Cartogràfic i Geològic de Catalunya (ICGC), Barcelona, Spain.
- Kevin Hunt, New York State Department of Transportation, USA.
- Richard Fairhurst, Riverside County Transportation and Land Management) CA, USA RCTLMA,
- National Institute for Water and Atmospheric Research (NIWA) and Land Information New Zealand (LINZ) - Crown Copyright Reserved.
- Resource Management Service, LLC, Birmingham, AL, USA.
- All others who supported us along the way.

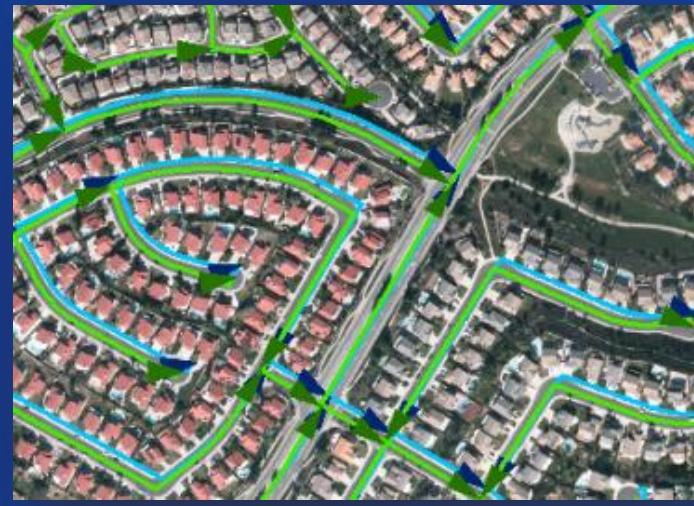

# User story 1: Enhancing county roads by spatially more accurate city roads

County centerline attributes and direction must be retained.

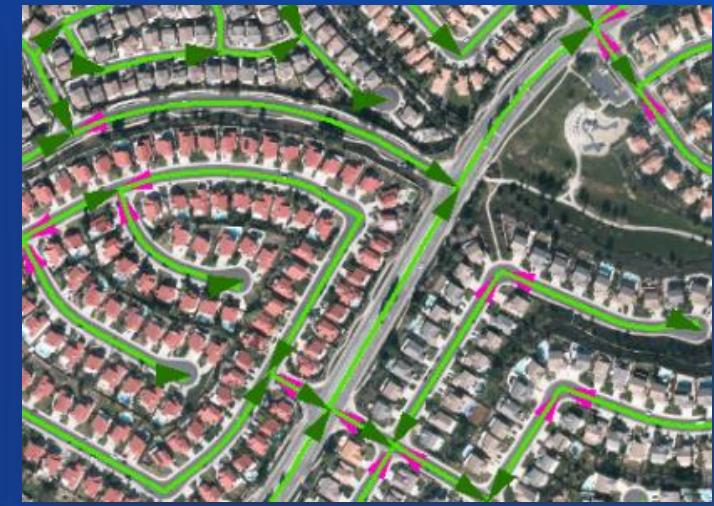

Original\_county\_centerlines  
Temecula\_city\_centerlines

Updated\_county\_centerlines  
Original\_county\_centerlines

Updated\_county\_centerlines  
Temecula\_city\_centerlines

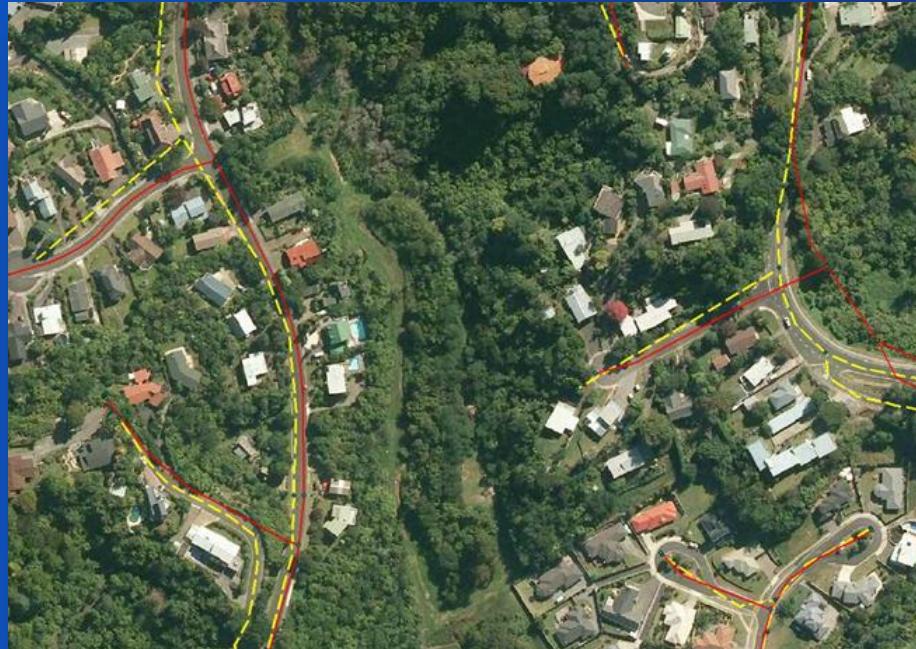

- Use DFC to find matching features and line direction differences
  - For 1:1 matches, flip city centerlines of opposite direction (Flip Line)
  - For m:n matches, merge/split city or county centerlines to get 1:1 matching segments, recalculate address ranges for county roads as needed, and flip city centerlines of opposite direction (tools + scripts)
- Transfer city centerline geometry to county centerlines (script)

~ 98%+ accuracy

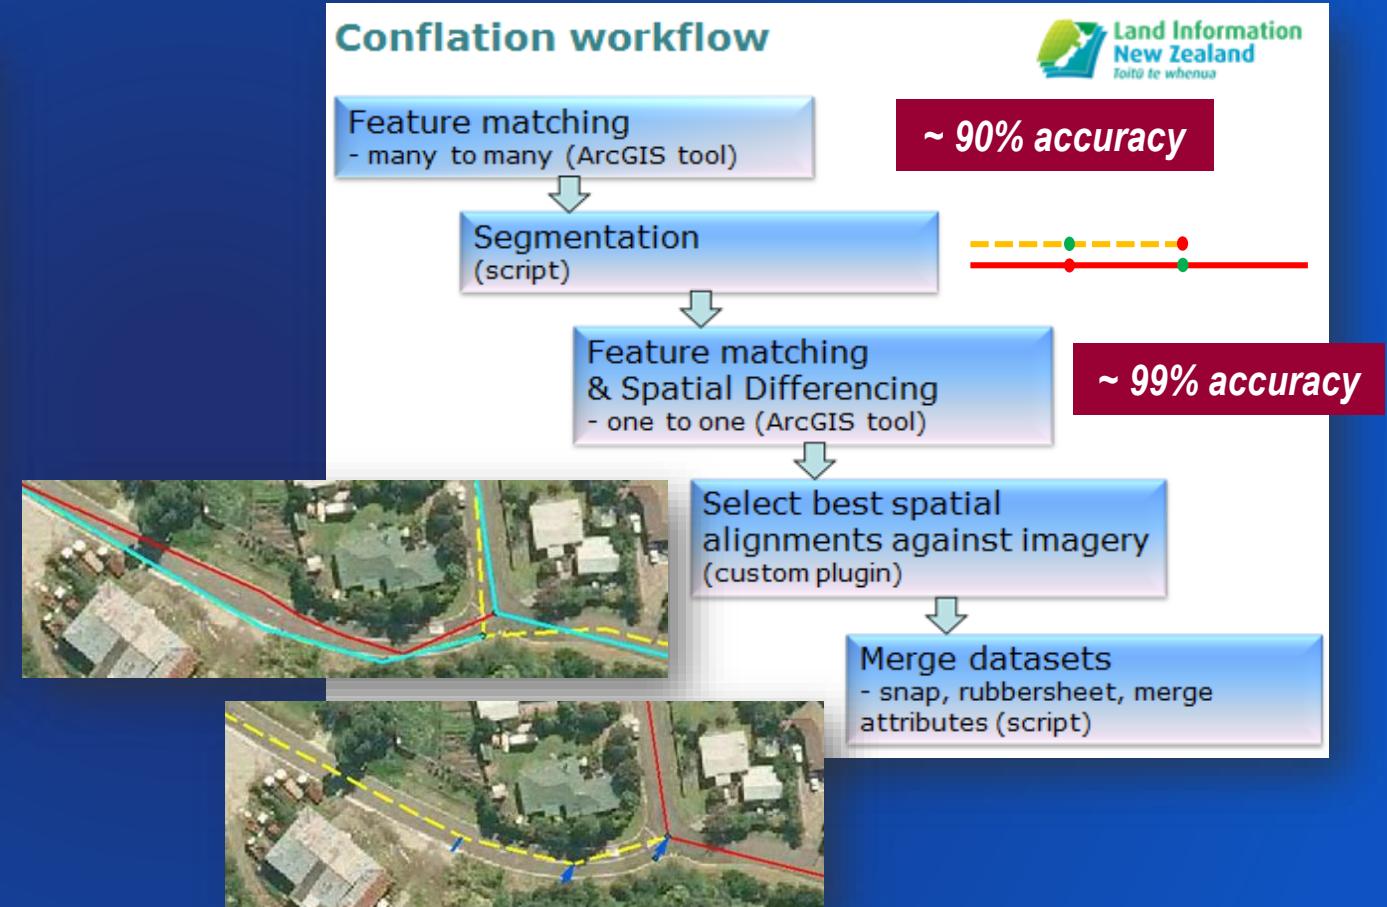

Data/information source: RCTLMA (Riverside County Transportation and Land Management) CA, USA  
Acknowledgement: Thanks to Richard Fairhurst, for providing the information and screenshots.

# User story 2: Combining electoral roads and topographic roads

There is no “most accurate” dataset.

— Electoral roads  
— Topographic roads

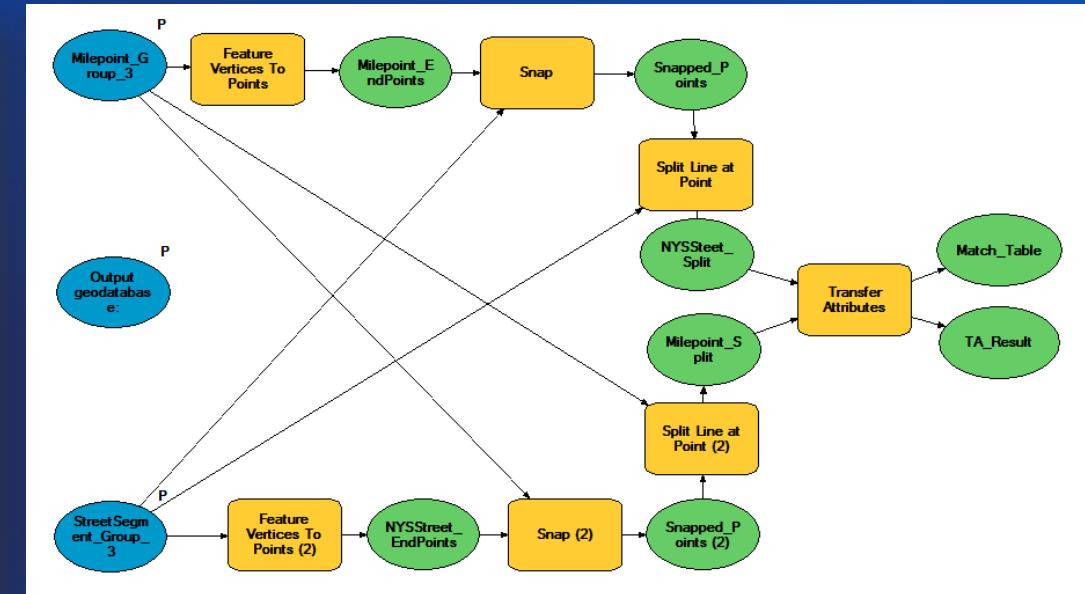

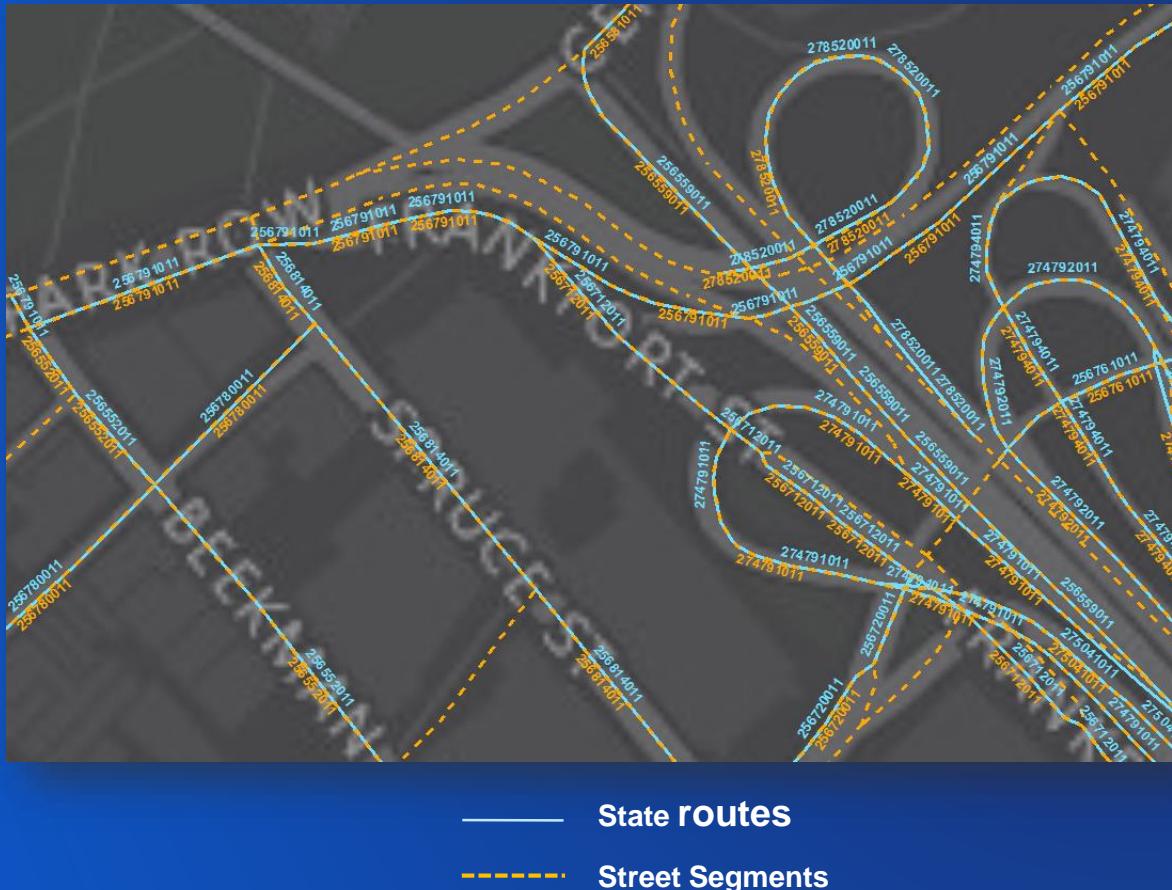

Information source: Land Information New Zealand (LINZ)

Acknowledgement: Thanks to Douglas Kwan, LINZ, for providing the information.

# User story 3: Transferring attributes from State routes to Street segments

Segmentation for the datasets was different

- State Routes and Street segments were split by end points to provide a more similar segmentation between the two datasets.

~99.5% matching rate

Data/information source: NYSDOT, USA

Acknowledgement: Thanks to Kevin Hunt, for giving us the opportunity to work with him and share his data.

# Conflation is a necessity and goes a long way

## It can be done more efficiently now

- **Customize workflows for your scenarios**

## It improves data quality and usability

- **It adds value to your data; time is worth spending**

## You can better collaborate with the communities

- **Sharing up-to-date and consistent data**
- **Performing reliable analysis and quality mapping**

*Please send us your feedback and share  
your stories ... [dlee@esri..com](mailto:dlee@esri..com) ☺*

# Future work

## New tools and enhancements

- Improve pattern recognition and feature matching
- Further enhance outputs
- Develop new tools to support more use cases and other feature types

## Integrated processing and inspection system

- Tasks based Conflation Manager for ArcGIS Pro

## Formalization of workflows

- Focus on common needs (e.g. multi-scale data updating and linking features)
- Incorporate other data sources (imagery, lidar, GPS)
- Research on contextual conflation (spatially related features)

# Conflation Manager (ConfMgr)

The screenshot illustrates the ArcGIS Pro interface for managing spatial data. The Feature Layer ribbon is open, showing various editing and selection tools. A map view displays a city area with several features selected, and the Conflation Inspector is open, showing a table of matches between datasets. The Tasks dialog box is open, listing a series of steps for a conflation task, with the 'Open the Conflation Inspector' step highlighted. The Conflation Scenarios dialog box is also visible, providing options for different conflation scenarios.

Tasks

Transfer Attributes

Tasks | Messages

- Preparation (optional)
  - Clarify topology
  - Split lines by match (if the tool is created...)
- Automatic processing
  - Run TA and Evaluation process
- Review
  - Open the Conflation Inspector
  - Review potential match issues
  - Review potentially missed matches
  - Review multiple source transfers (optional)
- Completion
  - Finalize the transfer
  - Generate a report about the process (optional)

Conflation Scenarios

### Single Tasks

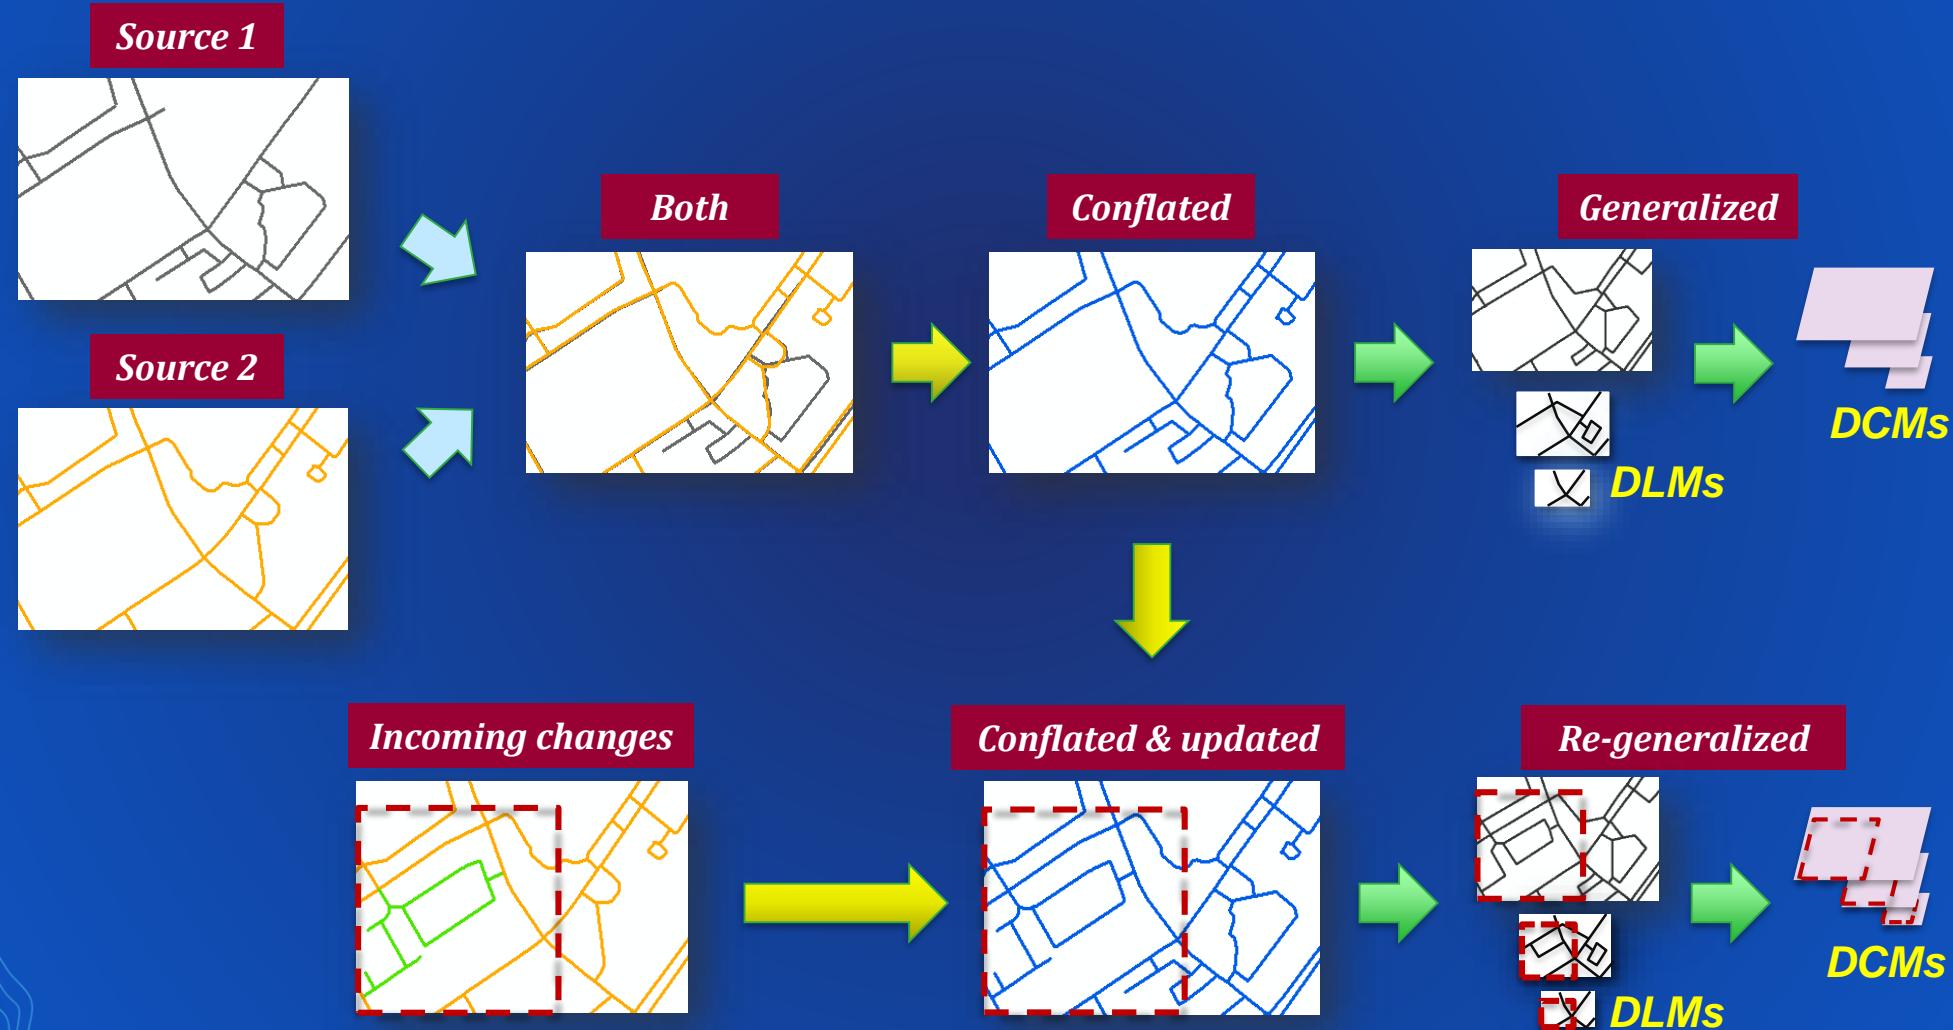

- Detect spatial and attribute changes between two datasets.
- Perform rubbersheeting adjustment to bring source features closer to target features.
- Transfer user specified attributes from source to target features
- Perform edgematching adjustment to connect input features with adjacent features.
- Align input features with target features.

### Comprehensive Tasks

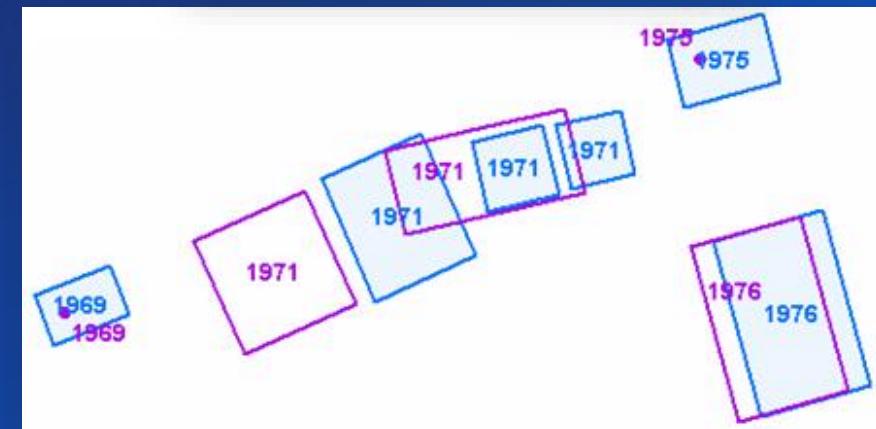

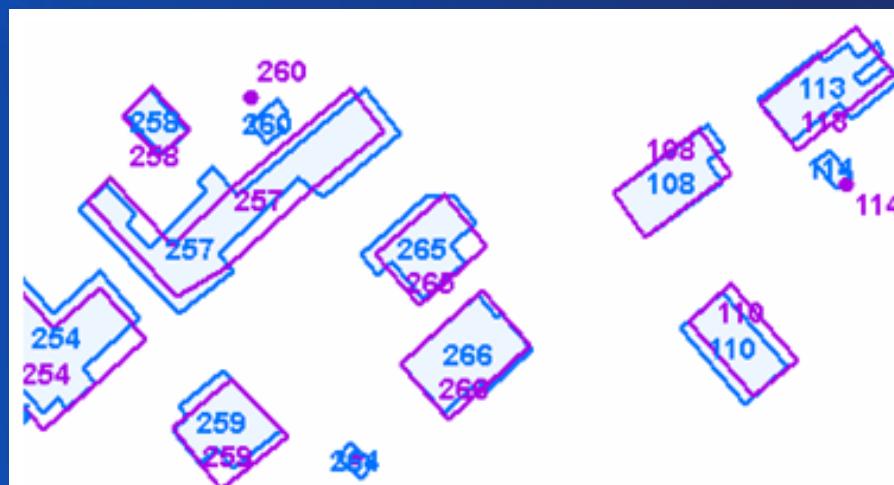

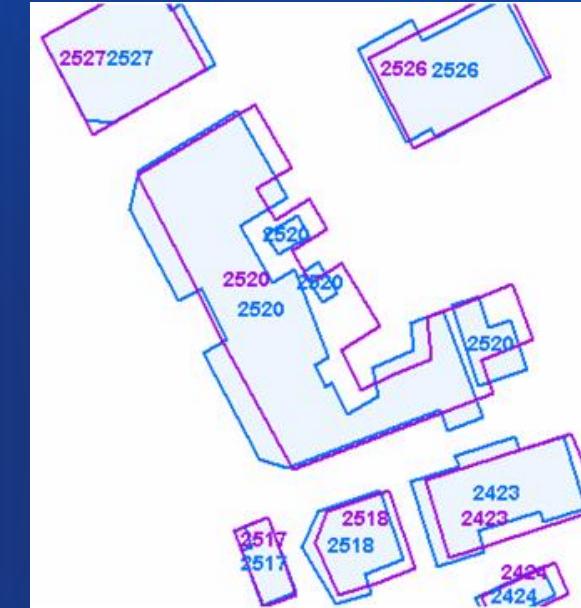

- Unify two datasets  
Reconcile spatial and attribute differences.

# Conflation in multi-scale data updating and mapping

*DLM – digital landscape model; DCM – digital cartographic model*

# Example of linking features: ICGC 1:5k and 1:25k buildings

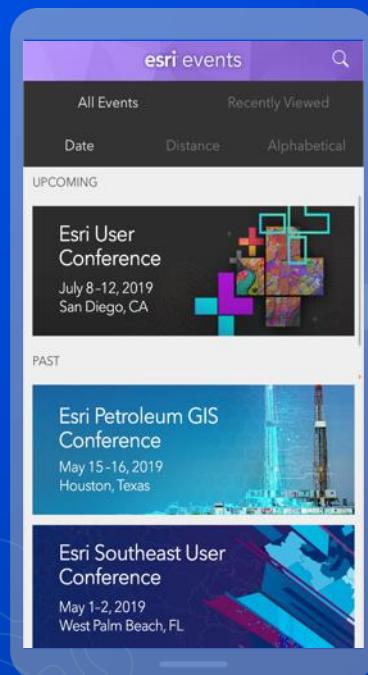

*This session will repeat at  
4:00pm – 5:00pm, Wednesday  
Room 08*

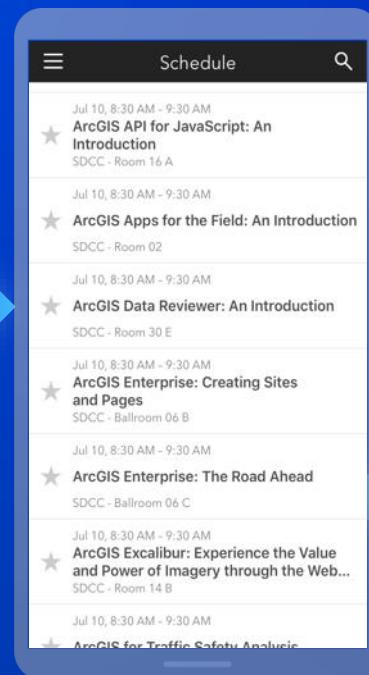

*Conflation: Edgematching Tools  
and Workflows  
12:15pm – 1:00pm, Tuesday  
Demo Theater 10*
