Supporting fire education & prevention

Pacific Northwest (PNW) Wildfire Coordination Group helps build wildland fire resiliency among Fire Adapted Communities (FACs) through annual community visits by federal interagency Fire Prevention & Education Teams (FPETs)

FACs are located in a wildfire prone areas and actively prepare for the eventuality of wildland fire.

FACs approach wildland fire preparation by integrating people, structures, businesses, infrastructure, and cultural resources with the natural area.

Data source & development history

 National fire incident dataset created (& annually updated) using wildfire records of federal, state, and local fire organizations' reporting systems.

Spatial wildfire occurrence data for the United States is available at:

https://www.fs.usda.gov/rds/archive/Product/RDS-2013-0009.4/

(or use https://tinyurl.com/firedata)

- Supports the national interagency Fire Program Analysis (FPA) system
- The data used by PNW FPETs subset of the national dataset for Oregon and Washington.

The initial request...

Create lots of paper maps with a LOT of information on them...

for a lot of areas some we know now some we'll know later

Some data we must have, but there are SO MANY data points that we'll have to figure out how much can fit on map.

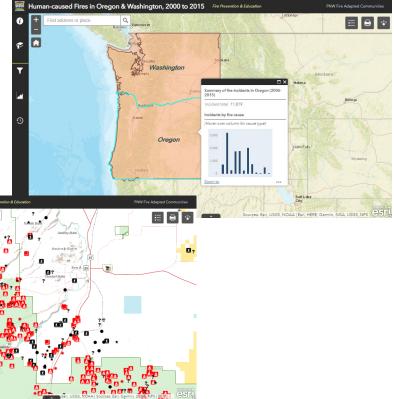

Thinking beyond the paper map...

What if... a web-GIS application is designed that that offers FPETs and fire support staff flexibility and data consistency?

Still need to print map... if we need to!

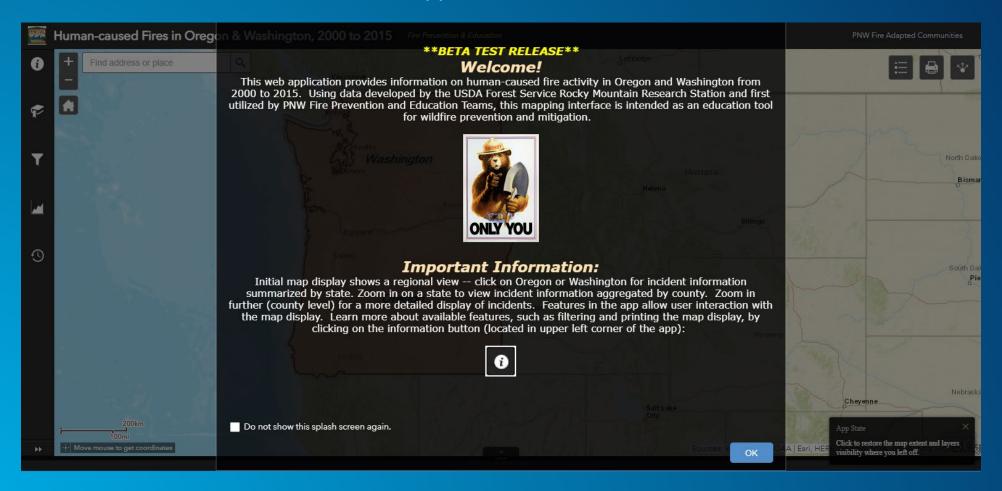

Technical Demonstration

Application available for view at:

https://tinyurl.com/FPETapp

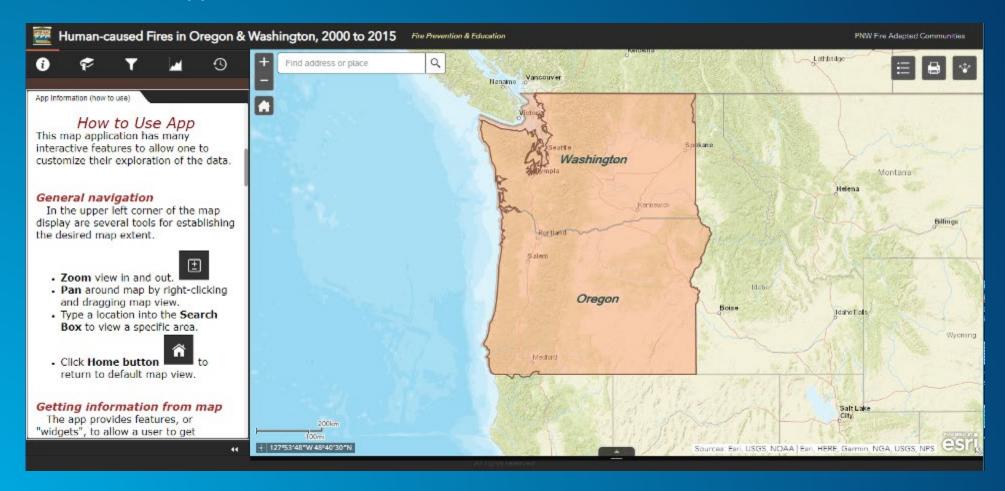

The Welcome Splash Screen states application's purpose, and where to find information on "How To Use" app

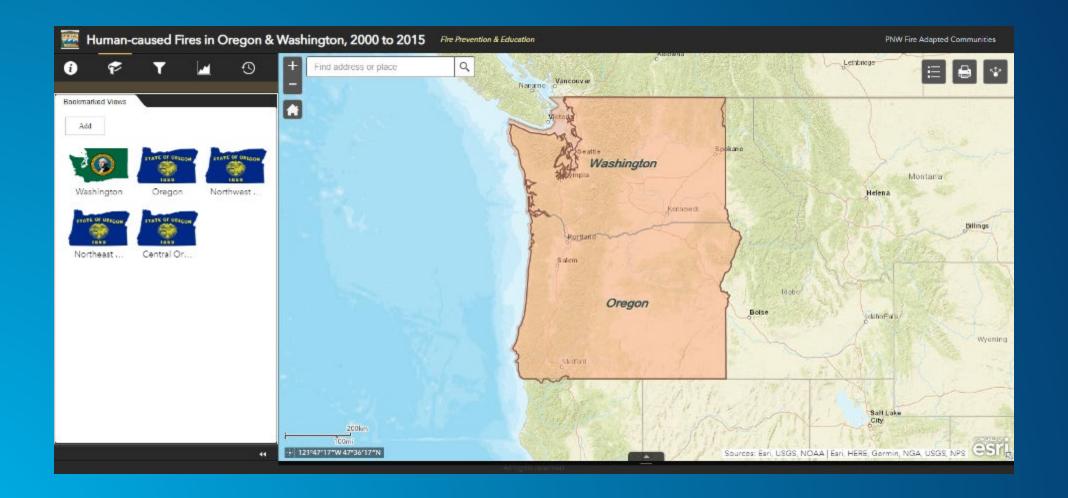

Information Button includes more details on app development, source data, and how to interact with application features

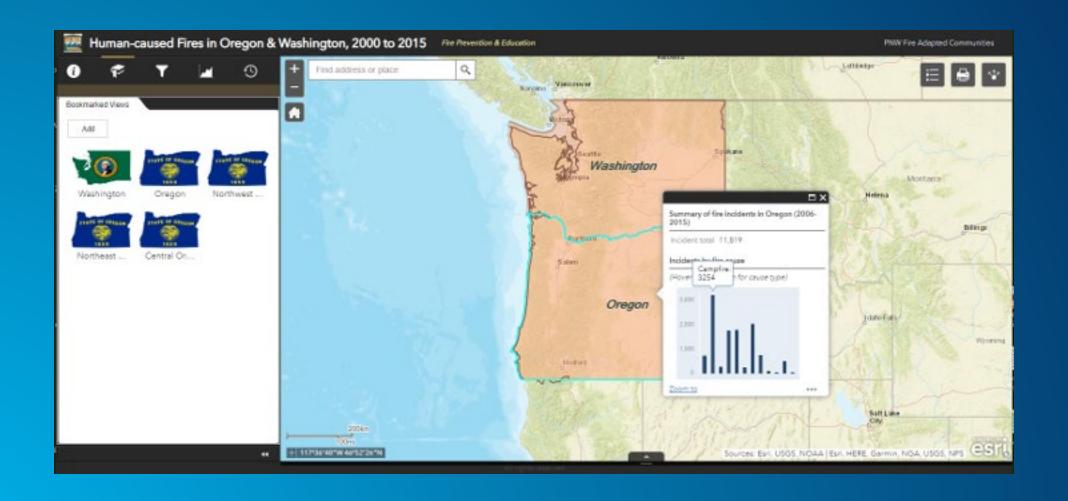

Bookmarks can be preset for team use ahead of time

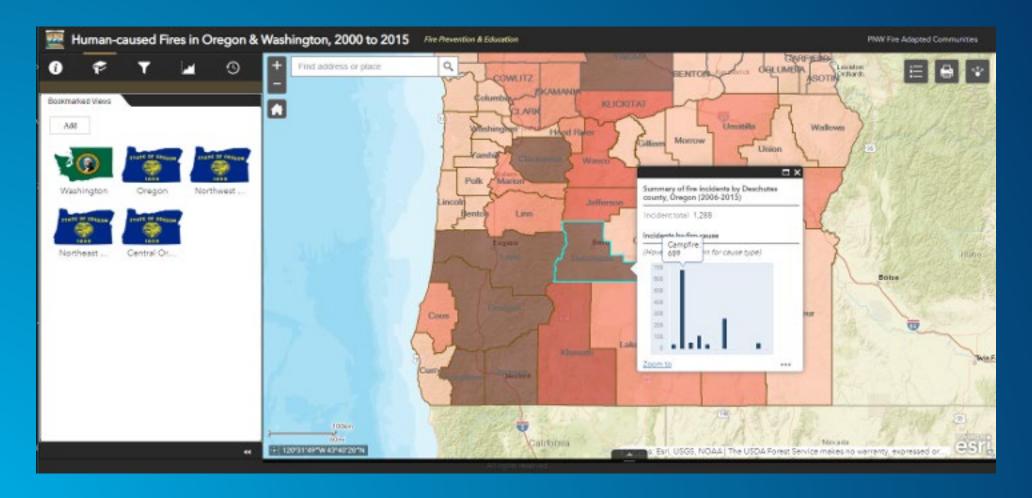

Looking a state-level scale, pop up shows chart of human-caused fire incidents for selected state

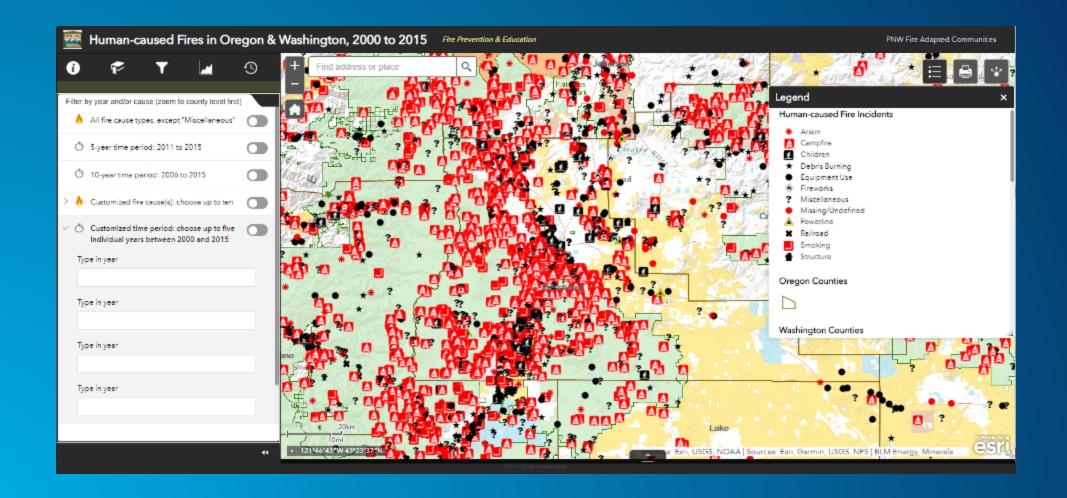

Looking within the state, counties are symbolized by total fire incidents Pop up shows chart of human-caused fire incidents for selected county

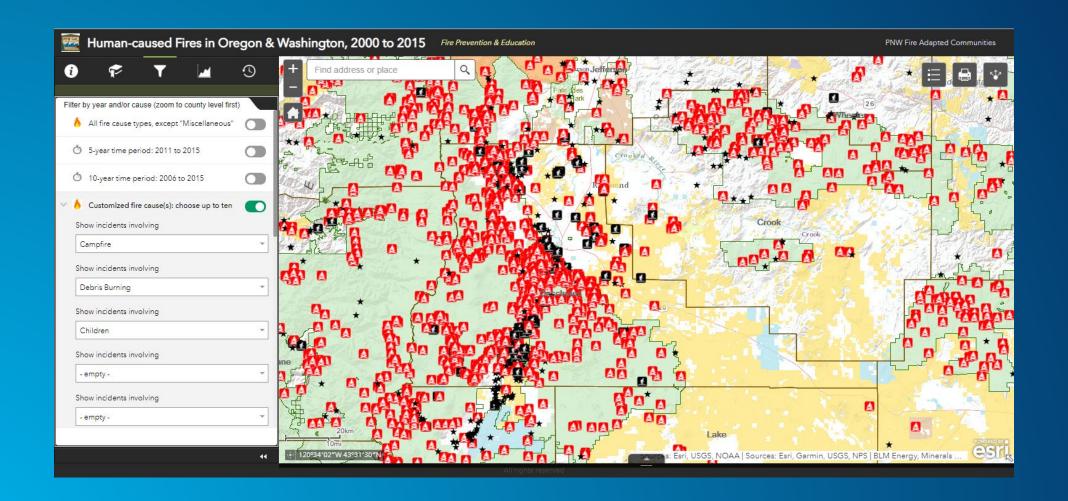

A wealth of data!... but without filtering it is overwhelming to make sense of

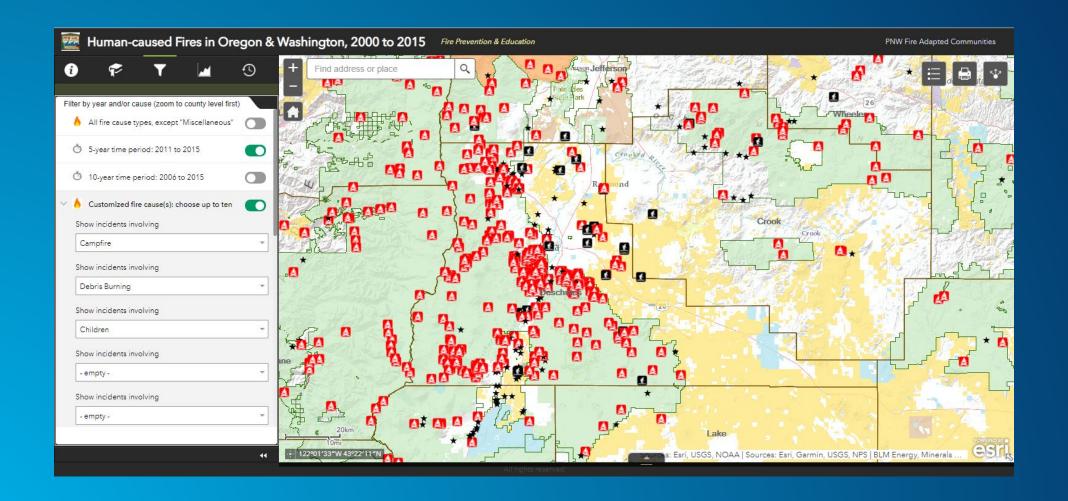

Ability to filter by top three cause types for area of interest

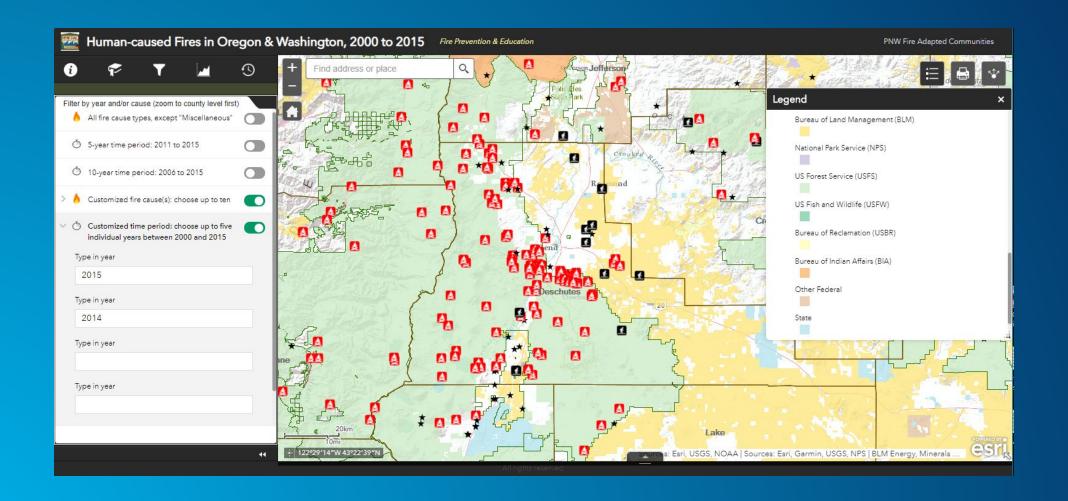

Ability to add filter for time period of interest (5-year span)

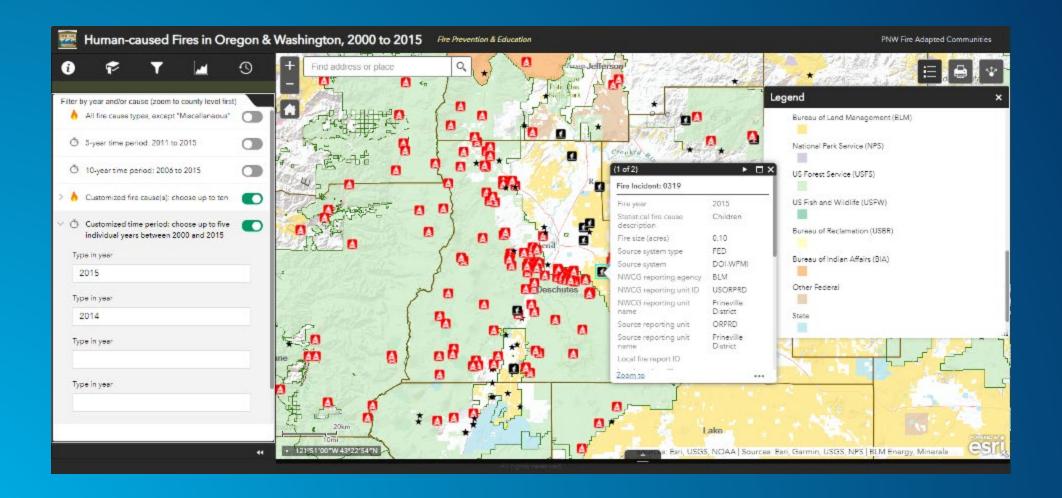

Ability to customize time period of interest (i.e., 2014 & 2015)

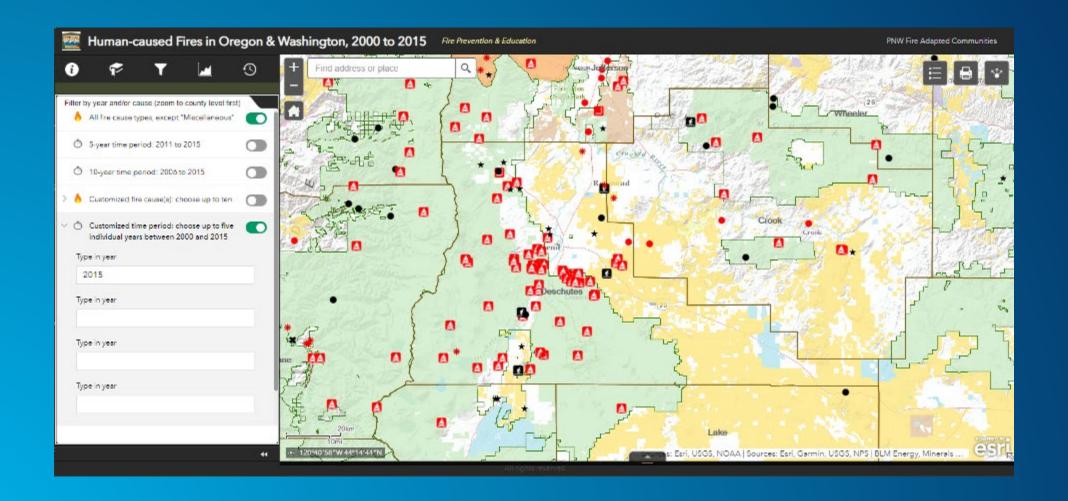

Ability to assess spatial distribution on different public lands

View of all data for 2015, with exception of Miscellaneous

Ability to establish areas of interest for charting statistics

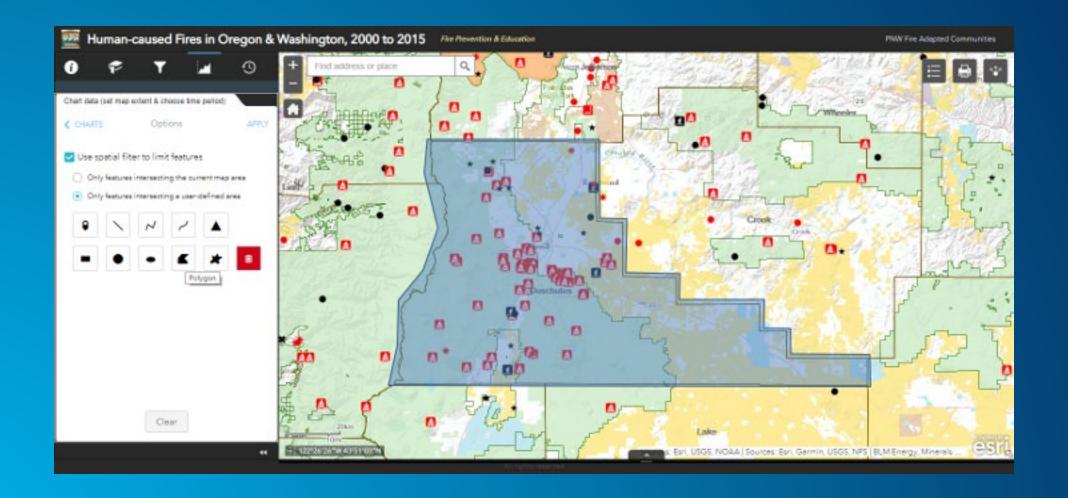

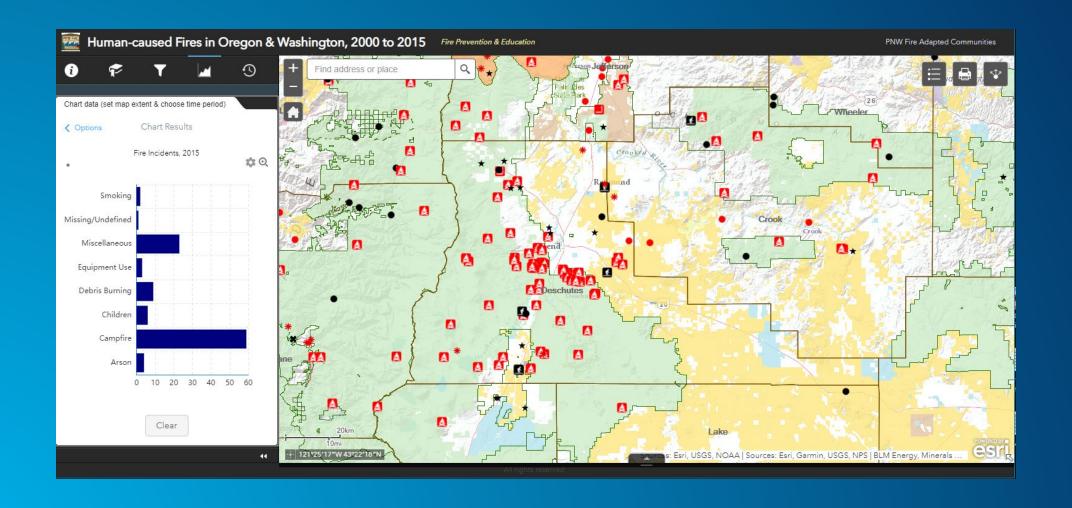

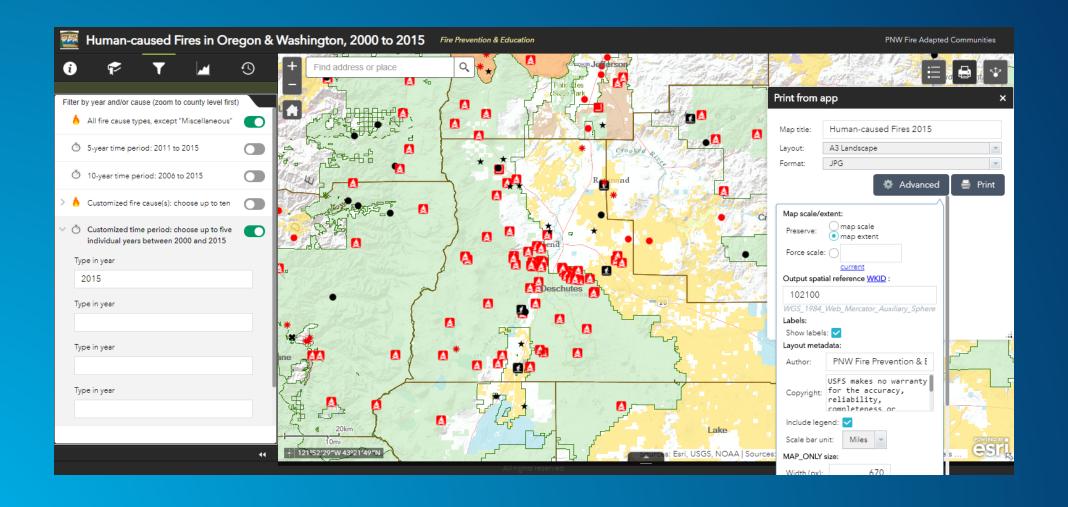

Chart statistics for areas of interest on the fly

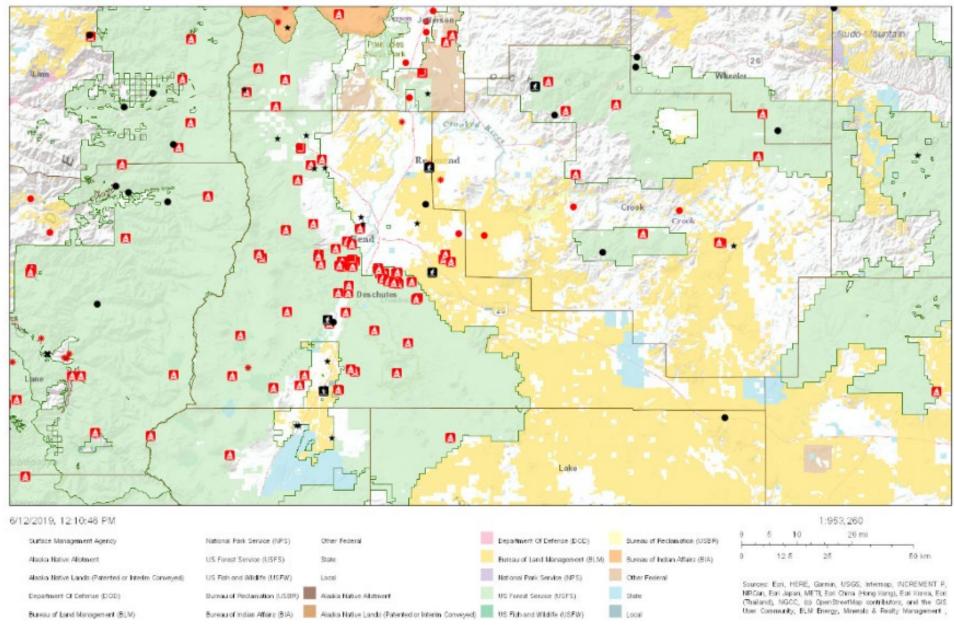

Ability to create customized maps in field

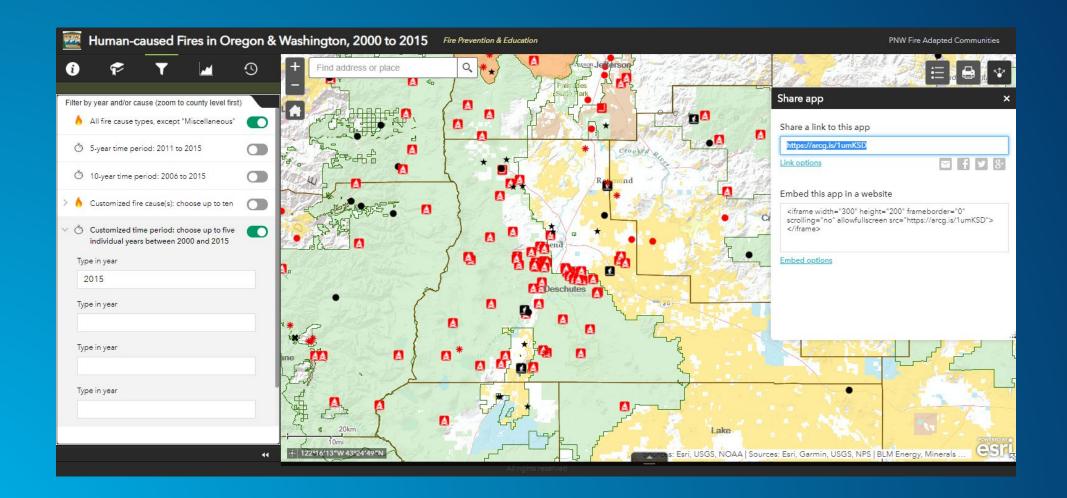

Human-caused Fires 2015

Map Output

Ability to share customized views of app

Next Steps...

• Interest in a nationwide app or "sister apps" for each Forest Service administrative region

Considerations:

- Wealth of data from full dataset could cause issues in app (i.e., widgets functioning properly and timely)
- Who will manage long term
- Need for some additional field testing of existing app, and design adjustments
 - Will be adding in newer data years recently made available
