Stakeholder Funding

MN DNR Culvert Inventory Application Suite

The **MNDNR Culvert Inventory Application Suite** consists of the following related components:

- 1) **Collector for ArcGIS Mobile Application** – for field data collection
- 2) **ArcSDE Centralized Database** – for multi-user editing/storage
- 3) **MNDNR Web Application** – Custom App for data review and approval
- 4) **Published Statewide GIS layers** – for GIS applications

DNR Culvert Inventory Resources: http://www.dnr.state.mn.us/watersheds/culvert_inventory/index.html

Culvert Suite Purpose

- To allow simultaneous collection of culvert locations and attributes in a standardized manner by professional staff across Minnesota
- To build a statewide database of culvert features which can be used for a variety of purposes, including:
 - ❖ Hydrologic connectivity of the landscape
 - ❖ Fish/Species Passage
 - ❖ Flood control and hydrologic modeling
 - ❖ Water quality/sediment transport
 - ❖ Hydro-modification of LiDAR-derived DEMs

Culvert Suite Purpose

- The collection of data in digital format and the standardization of attributes is paramount to creating a standardized database of features.
- These tools brought efficiencies into outdated agency processes by reducing data entry time, minimizing human error, and making data available in real-time.

1. INTRODUCTION

There is considerable interest in making use of the new LiDAR-derived digital elevation models (DEMs) in Minnesota² for water resource projects. LiDAR DEMs provide a very precise depiction of the land surface. However, LiDAR captures the topography of the landscape and all human-created features *upon* it. LiDAR DEMs do not inherently include important information about *subsurface water conveyance* connections such as culverts, drain tiles, and storm sewers. As a result, bridges, roads and other structures on the landscape effectively act as virtual dams ("digital dams"), preventing terrain analysis algorithms from properly routing the flow of water across the DEM landscape. Figure 1 below identifies many LiDAR DEM digital dams caused by culverts. This figure illustrates the magnitude of the problem, especially when all the culverts in the state are considered. The digital dam problem and other related issues have been documented by numerous scientific investigators (Poppenga et al. 2010; Maidment 2002; Hutchinson and Gallant 2000; Hutchinson 1989).

Hydrologic analyses conducted using DEMs that do not account for subsurface water conveyance are generally suspect. As a result, LiDAR DEMs need to be manipulated to allow the passage of water through digital dams. Fortunately, there are methods for modifying DEMs

Culvert Suite Crowdsourcing

- Leveraging Crowdsourcing
 - 87 Counties
 - 45 Watershed Districts
 - 90 Soil and Water Conservation Districts (SWCD)
 - State Agencies
 - Department of Natural Resources (DNR)
 - Board of Water and Soil Resources (BWSR)

Culvert Inventory Application Suite

Purpose

- To allow simultaneous collection of culvert locations and attributes in a standardized manner by professional staff across Minnesota
- To build a statewide database of culvert features which can be used for a variety of purposes, including:
 - Hydrologic connectivity of the landscape
 - Fish/Species Passage
 - Flood control and hydrologic modeling
 - Water quality/sediment transport
 - Hydro-modification of LiDAR-derived DEMs
- This work was funded by the following stakeholders:

1) COLLECTOR for ARCGIS MOBILE APPLICATION

Collector for ArcGIS Mobile Application allows for field scale collection of data about stream crossings, culvert openings, bridges and DEM digital dam breachlines.

- Crossing Points representing bridges and culverts are represented as a single master point. (Crossings may have multiple culverts)
- Individual culverts are represented as a set of paired points for the inlets and outlets.
- With wireless connectivity, georeferenced data collected in the field is uploaded directly to a centralized SDE database.
- There are two alternate user forms for data collection; a Long Form based on *MNDNR Stream Crossing Full Assessment Form* and a Short Form based on *Interim Guidance on Acquisition of Culvert Geospatial Data*

1) A single master point feature represents the road crossing. Attributes specific to the crossing are entered such as surveyor, survey purpose, crossing type, number of culverts, and total span.

3) Once an inlet point is placed, it is selected and attribute data can be copied to a new point using the *Copy Like This One, At My Location* function. Next, move the outlet point to the appropriate location.

2) For culverts, there will be two points; one point each for inlet and outlet. To begin, the user will click on the map at the location of the inlet and enter the attributes associated with the feature.

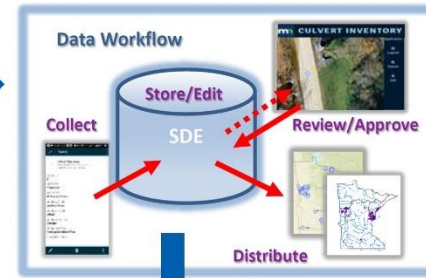

4) Once the outlet point has been placed, the attributes that are unique to the outlet are modified. The points and attributes are then submitted and synced with the ArcSDE database.

The MNDNR Culvert Inventory Application Suite consists of the following related components:

- 1) **Collector for ArcGIS Mobile Application** – for field data collection
- 2) **ArcSDE Centralized Database** – for multi-user editing/storage
- 3) **MNDNR Web Application** – Custom App for data review and approval
- 4) **Published Statewide GIS layers** – for GIS applications

DNR Culvert Inventory Resources: http://www.dnr.state.mn.us/watersheds/culvert_inventory/index.html

2) ARCSDE CENTRALIZED DATABASE

The centralized database allows the following:

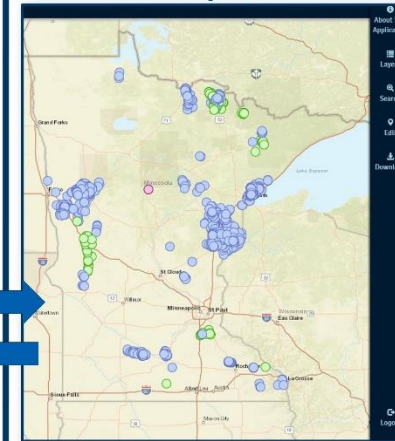

- Simultaneous editing by multiple users
- Standard data domains and values
- Secure centralized data storage
- Regular data backup and maintenance

4) PUBLISHED STATEWIDE GIS LAYERS

- Standardized GIS layers available to all users and only "approved" crossing features are added to GIS layers
- Multiple layers and symbolization possible
- GIS Layers available via MN GeoSpatial Commons

3) MNDNR WEB APPLICATION

Developed by DNR, the Web Application allows data stewards to conduct in-office review, editing, and approval of their data locations and attributes created in the field using the ArcGIS Collector App.

- Feature locations and attributes can be edited and standardized using drop down domains, and some auto-populated.
- Crossings Points are assigned unique Crossing ID's, associated culverts & bridges are associated with their master crossing point.
- Users are assigned different roles with increasing levels of 'rights' to perform certain editing and approval functions.
- Approved features are exported to MN GeoSpatial Commons

How to get started

- 1) Contact MNDNR* for a Culvert Inventory Application Suite login.
- 2) Obtain an Android, iOS or Windows 10 device for data collection.
- 3) Follow instructions from MNDNR on how to download and operate the application suite.
- 4) Submit existing culvert inventory, bridge inventory or breach line data to **Andy*** (right)

Authorized by **MNIT@MNDNR Geospatial Water Resources Team (GeoWRT)**

The **LAYERS** Button expands the legend to show symbol levels for the layers.

The five Feature Status Levels are:

- Candidate** – all features are assigned this status by default.
- Reviewed** – these features have been reviewed for accuracy and completeness by the Data Collector and are ready for approval.
- Question** – these features have a question asked about them and are waiting a response.
- Approved** – these Reviewed features have been approved by the Approver-Business for business related uses.
 - Archived** – these un-editable features have been "retired".

The **EDIT** Button expands the legend, allowing for creation of new points and the populating of Spatial Attributes for the Crossings using tools under **Set Attributes**.

- Using the **Select** button, select the Crossing point, hit **Populate Crossings** to add attributes
 - The Crossing ID is assigned based on DNR Level 08 Catchment and the crossing feature type.
- Select the Culvert Openings associated with this Crossing and hit **Associate** to assign the Crossing ID to the Culvert Openings.

Set Status tracks the Review and Approving process for Crossings, Bridges and Culvert Openings.

The **DOWNLOAD** Button allows the download of all features or selected features

The **Search Panel** allows users to find features based on locations and attributes:

- Click on any search result to zoom to that area or feature.

1) Collector

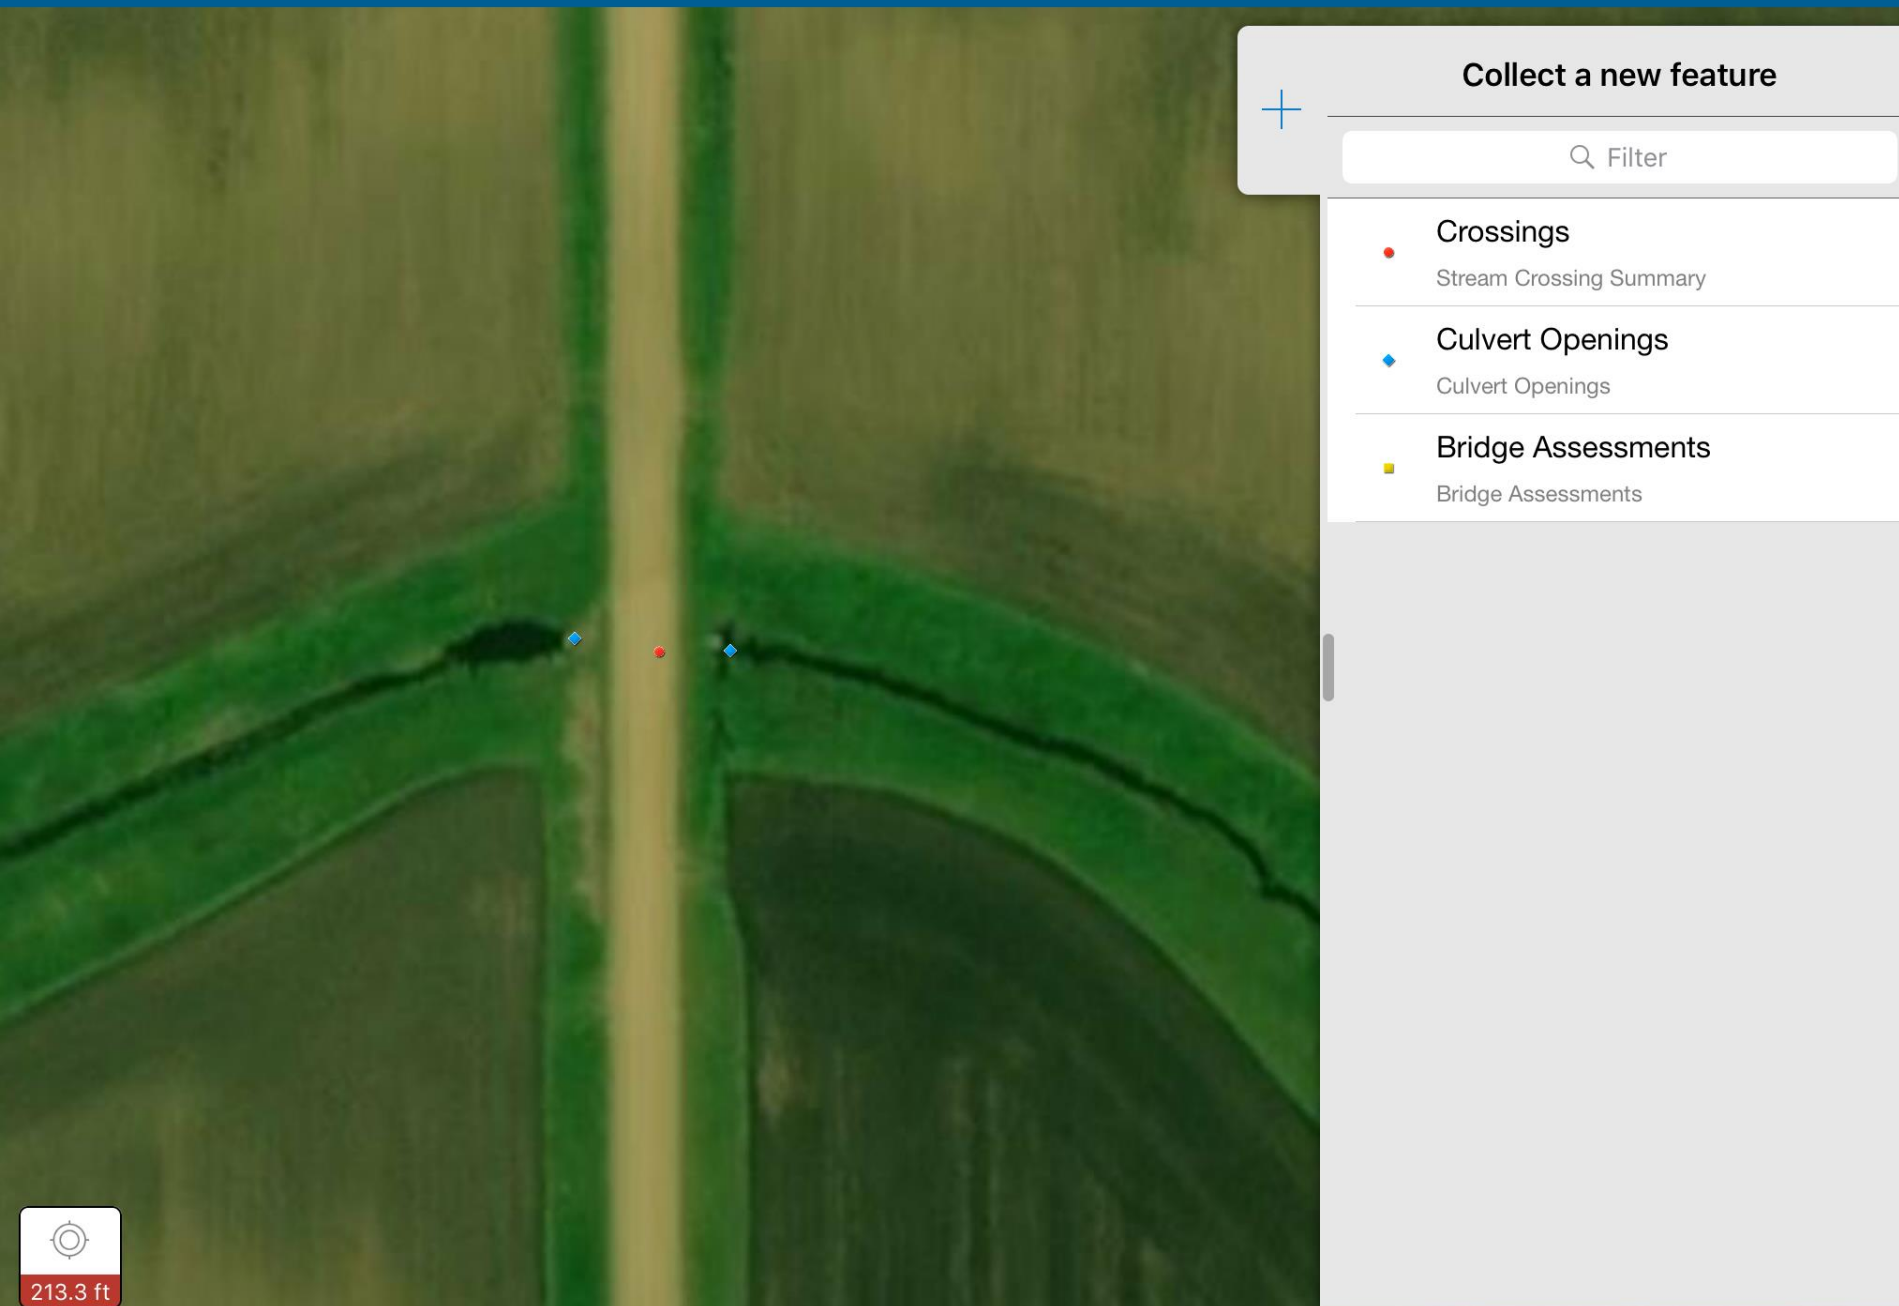

1) Collector

- The Collector for ArcGIS Mobile Application allows for field scale collection of data about stream crossings, culvert openings, bridges and DEM digital dam breachlines.

Cancel

Submit

1) Collector

- Crossing Points representing bridges and culverts are represented as a single master point. (Crossings may have multiple culverts).

1) Stream Crossing Summary

Stream Crossing Summary

Surveyor: Choose name from the domain List

Field Date: Click on TODAY to enter today's date.

Survey Purpose:

- Fish Passage
- Routine Structure Assessment
- Post-Event Assessment

Crossing Type:

- Span Bridge – A bridge has a deck supported by abutments (or stream banks)
- Ford – A ford is a shallow, open stream crossing in which vehicles pass thru water
- Culvert – A culvert consists of a structure buried under some amount of fill

Number of Culverts: Total number of culvert openings that together convey water thru crossing.

Number Culverts left to right while looking downstream toward the culvert inlet. These numbers will correspond to Pipe ID on Culvert Openings Form.

Total Span ft: Width of the opening. For culverts, sum of all spans. Bridges-width between abutments

Bankfull Estimate Confidence: High, Medium, or Low

Add Photo Attachments – Identify flow direction

- 1) Crossing, facing upstream 2) Crossing, facing downstream
3) Stream, facing upstream 4) Stream, facing downstream from crossing

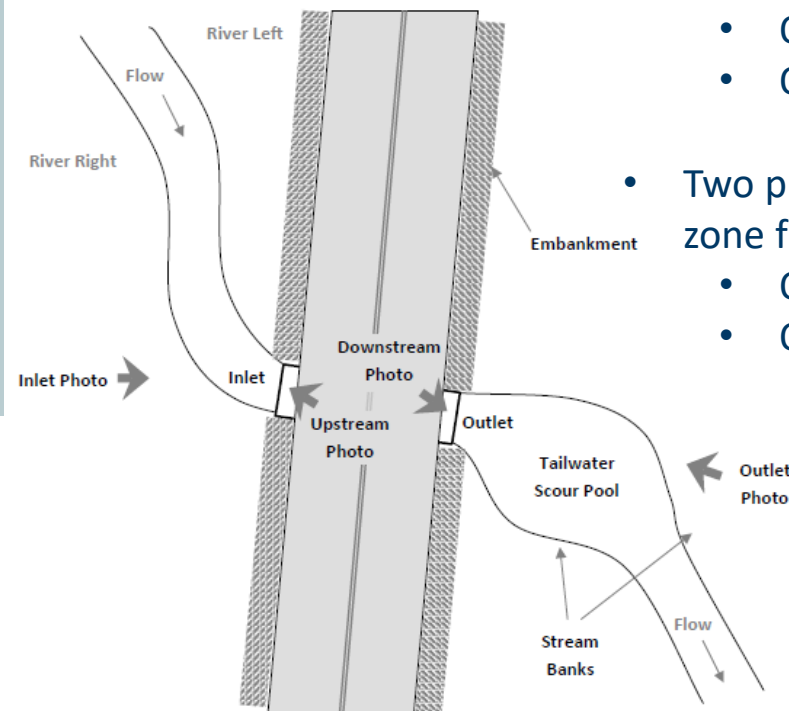

1) Photos Upstream and Downstream

Figure 5: A) image of structure looking downstream, B) image of structure looking upstream, C) image of stream looking downstream and D) image of stream looking upstream. Note that there is indication of flow direction in each picture.

A minimum of four photos are taken at each site (culverts, bridges, fords) to provide visual documentation of conditions at the time of site visit. (Note: something should be used to indicate direction of flow).

- Two Pictures of the structure itself
 - One from Upstream
 - One from Downstream
- Two pictures of the stream/riparian zone from the top of the crossing
 - One looking downstream
 - One looking upstream

Submit

1) Collector

- Individual culverts are represented as a set of paired points for the inlets and outlets.
- With wireless connectivity, georeferenced data collected in the field is uploaded directly to a centralized SDE database.

1) Culvert Openings

Culvert Openings

Pipe ID - Number that indicates the order that you evaluate the openings of a multi-culvert crossing (# left to right)

Inlet Type

Outlet Type

Opening Type

- **Thalweg** - For crossings with only one pipe, choose this option. For crossings with multiple pipes, the thalweg pipe is set at the bed elevation of the stream
- **Offset** - For crossings with multiple pipes, offset pipes are set at a higher elevation than the thalweg pipe, but are still intended to convey flows from the bankfull channel.
- **Floodplain** - Culverts set at an elevation that will convey only floodplain flows.
- **Other** - Other types of openings

1) Culvert Openings

Opening Shape – Use the categories from the images below. (Choose from list)

Length ft. – To the nearest tenth of a foot, measure the length of the structure at its top.

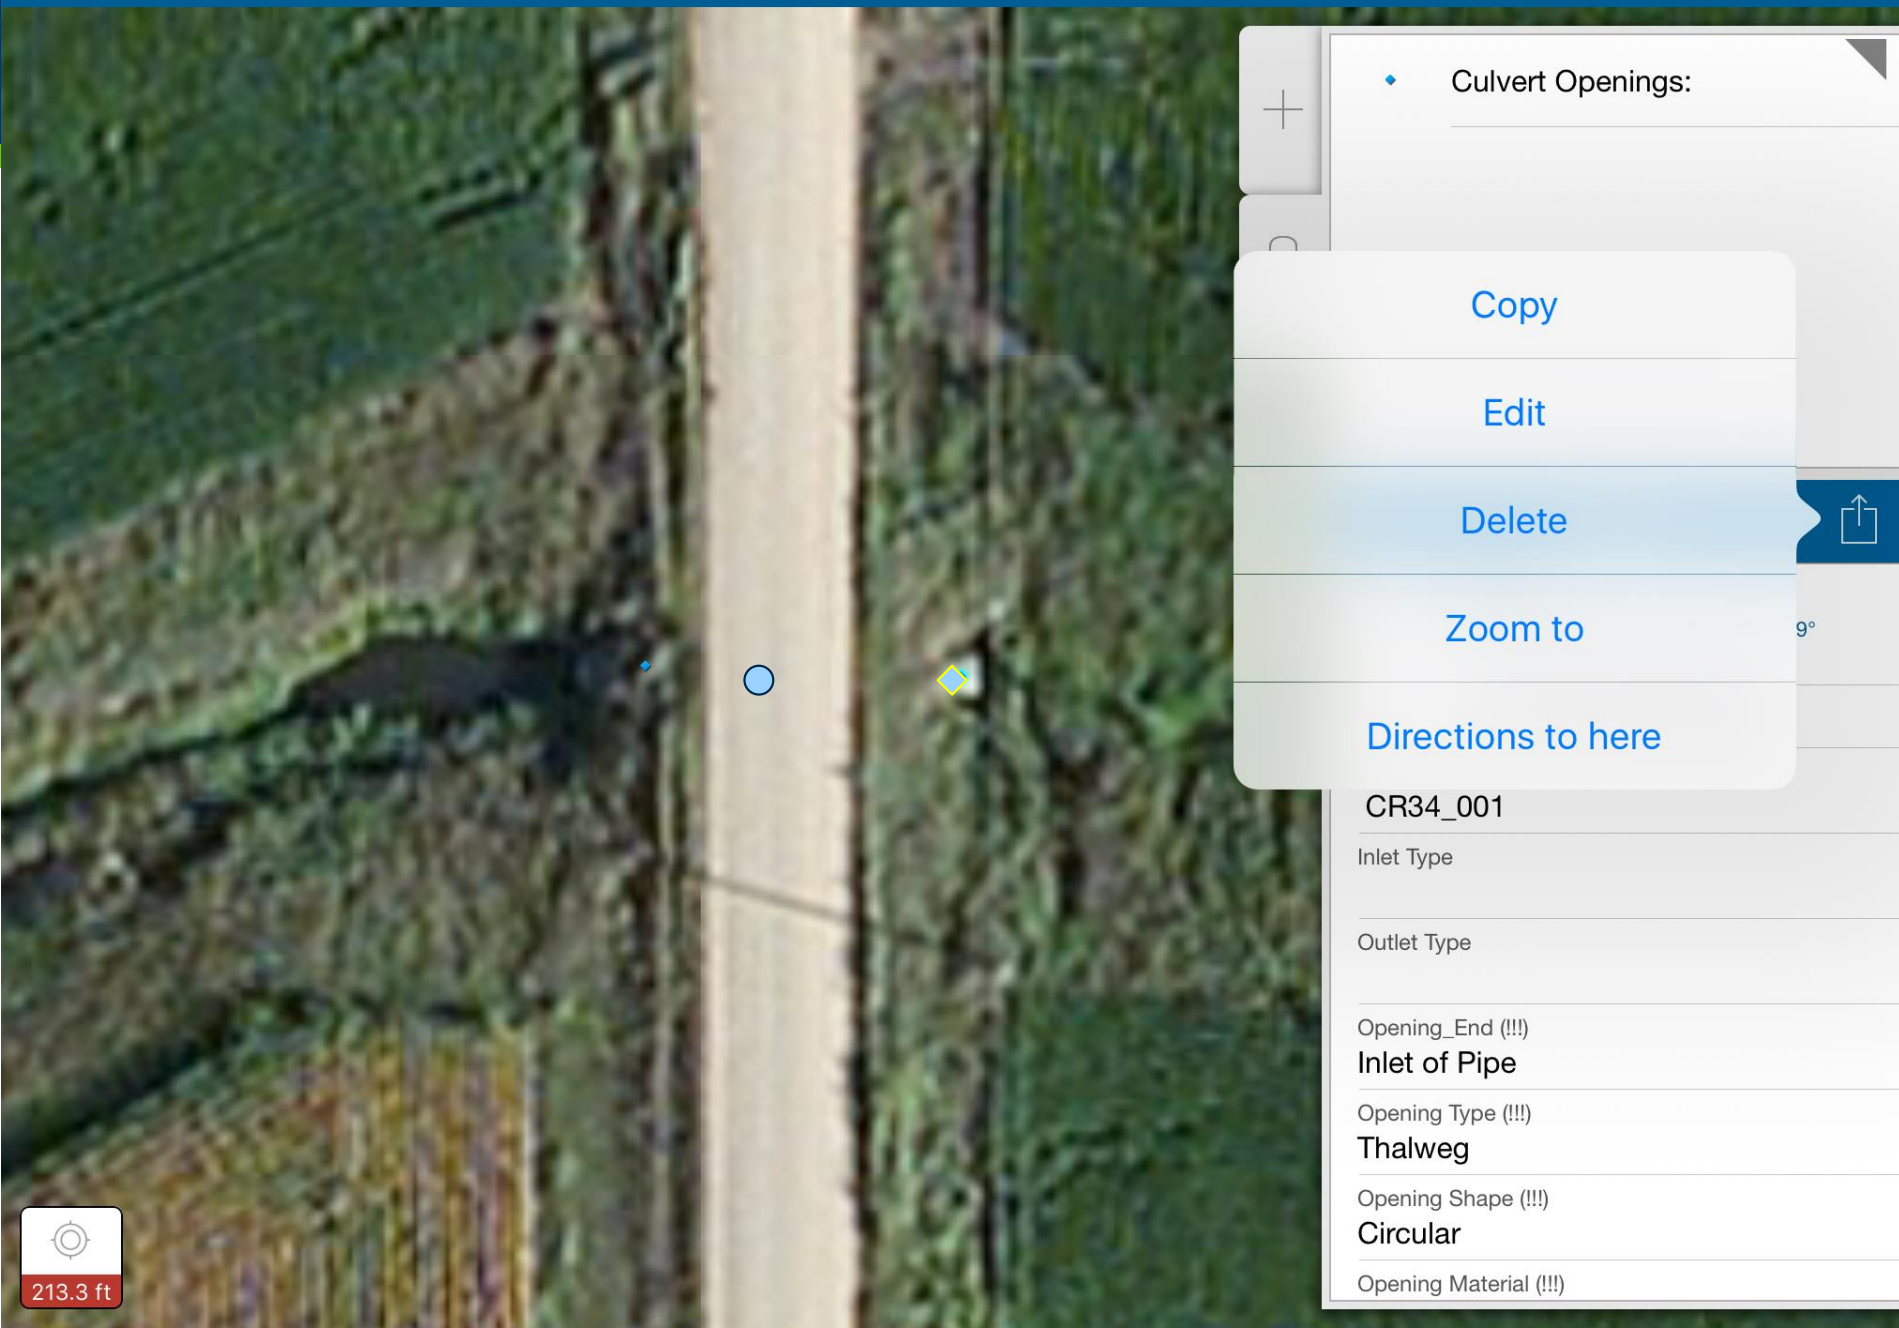

Size Span – To the nearest tenth of a foot, measure the full width of the structure inlet. Take this measurement inside the structure.

Size Rise – To the nearest tenth of a foot, measure the height of the structure inlet. Take this measurement inside the structure.

4) Published Statewide GIS Layers

The screenshot shows the Minnesota Geospatial Commons website. At the top is a search bar with the text "Search the Commons" and a magnifying glass icon. Below the search bar is the title "Minnesota Geospatial Commons" and a paragraph describing it as a collaborative space for users and publishers of Minnesota's geospatial resources. The main content area is titled "Featured Categories" and contains three columns. The first column is titled "Environment" and features a leaf icon, with text describing environmental resources, protection, and conservation. The second column is titled "Boundaries" and features an icon of a building with dashed lines, with text describing legal land descriptions. The third column is titled "Transportation" and features a car icon, with text describing means and aids for conveying persons and/or goods.

Search the Commons

Minnesota Geospatial Commons

The Minnesota Geospatial Commons is a collaborative space for users and publishers of Minnesota's geospatial resources. The Commons is used by researchers, cartographers, web and application developers, planners, journalists, and other citizens who need GIS data for a project.

Featured Categories

Environment

Environmental resources, protection and conservation. Examples: environmental pollution, waste storage and treatment, environmental impact assessment, monitoring environmental risk, nature reserves, landscape

Boundaries

Legal land descriptions. Examples: political and administrative boundaries

Transportation

Means and aids for conveying persons and/or goods. Examples: roads, airports/airstrips, shipping routes, tunnels, nautical charts, vehicle or vessel location, aeronautical charts, railways

- Standardized GIS layers available to all users and only “approved” crossing features are added to GIS layers
- Multiple layers and symbolization possible
- GIS Layers available via MN GeoSpatial Commons

MN DNR Culvert Inventory Application Suite

Purpose

- To allow simultaneous collection of culvert locations and attributes in a standardized manner by professional staff across Minnesota
- To build a statewide database of culvert features which can be used for a variety of purposes, including:
 - Hydrologic connectivity of the landscape
 - Flood control and hydrologic modeling
 - Hydro-modification of LiDAR-derived DEMs
 - Fish/Species Passage
 - Water quality/sediment transport
- This work was funded by the following stakeholders:

1) COLLECTOR for ARCGIS MOBILE APPLICATION

Collector for ArcGIS Mobile Application allows for field scale collection of data about stream crossings, culvert openings, bridges and DEM digital dam breachlines.

- Crossing Points representing bridges and culverts are represented as a single master point. (Crossings may have multiple culverts)
- Individual culverts are represented as a set of paired points for the inlets and outlets.
- With wireless connectivity, georeferenced data collected in the field is uploaded directly to a centralized SDE database.
- There are two alternate user forms for data collection; a Long Form based on *MNDNR Stream Crossing Full Assessment Form* and a Short Form based on *Interim Guidance on Acquisition of Culvert Geospatial Data*

1) A single master point feature represents the road crossing. Attributes specific to the crossing are entered such as surveyor, survey purpose, crossing type, number of culverts, and total span.

3) Once an Inlet point is placed, it is selected and attribute data can be copied to a new point using the *Copy Like This One, At My Location* function. Next, move the outlet point to the appropriate location.

2) For culverts, there will be two points; one point each for inlet and outlet. To begin, the user will click on the map at the location of the inlet and enter the attributes associated with the feature.

4) Once the outlet point has been placed, the attributes that are unique to the outlet are modified. The points and attributes are then submitted and synced with the ArcSDE database.

The MNDNR Culvert Inventory Application Suite consists of the following related components:

- 1) **Collector for ArcGIS Mobile Application** – for field data collection
- 2) **ArcSDE Centralized Database** – for multi-user editing/storage
- 3) **MNDNR Web Application** – Custom App for data review and approval
- 4) **Published Statewide GIS layers** – for GIS applications

DNR Culvert Inventory Resources: http://www.dnr.state.mn.us/watersheds/culvert_inventory/index.html

2) ARCSDE CENTRALIZED DATABASE

The centralized database allows the following:

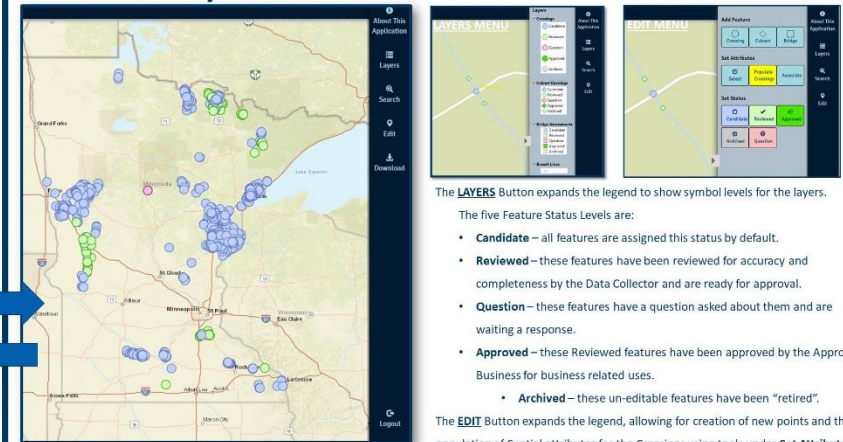

- Simultaneous editing by multiple users
- Standard data domains and values
- Secure centralized data storage
- Regular data backup and maintenance

4) PUBLISHED STATEWIDE GIS LAYERS

- Standardized GIS layers available to all users and only "approved" crossing features are added to GIS layers
- Multiple layers and symbolization possible
- GIS Layers available via MN GeoSpatial Commons

3) MNDNR WEB APPLICATION

The **LAYERS** Button expands the legend to show symbol levels for the layers.

The five Feature Status Levels are:

- Candidate** – all features are assigned this status by default.
- Reviewed** – these features have been reviewed for accuracy and completeness by the Data Collector and are ready for approval.
- Question** – these features have a question asked about them and are waiting a response.
- Approved** – these Reviewed features have been approved by the Approver-Business for business related uses.
 - Archived** – these un-editable features have been "retired".

The **EDIT** Button expands the legend, allowing for creation of new points and the populating of Spatial attributes for the Crossings using tools under **Set Attributes**.

- Using the **Select** button, select the Crossing point, hit **Populate Crossings** to add attributes
 - The Crossing ID is assigned based on DNR Level 08 Catchment and the crossing feature type.
- Select the Culvert Openings associated with this Crossing and hit **Associate** to assign the Crossing ID to the Culvert Openings.

Set Status tracks the Review and Approving process for Crossings, Bridges and Culvert Openings.

The **DOWNLOAD** Button allows the download of all features or selected features

The **Search Panel** allows users to find features based on locations and attributes:

- Click on any search result to zoom to that area or feature.

Developed by DNR, the Web Application allows data stewards to conduct in-office review, editing, and approval of their data locations and attributes created in the field using the ArcGIS Collector App.

- Feature locations and attributes can be edited and standardized using drop down domains, and some auto-populated.
- Crossings Points are assigned unique Crossing ID's, associated culverts & bridges are associated with their master crossing point.
- Users are assigned different roles with increasing levels of 'rights' to perform certain editing and approval functions.
- Approved features are exported to MN GeoSpatial Commons

How to get started

- Contact MNDNR* for a Culvert Inventory Application Suite login.
- Obtain an Android, iOS or Windows 10 device for data collection.
- Follow instructions from MNDNR on how to download and operate the application suite.
- Submit existing culvert inventory, bridge inventory or breach line data to **Andy** (right)

Authorized by **MNIT@MNDNR Geospatial Water Resources Team (GeoWRT)**

Culvert Suite Expanded Abstract

The Minnesota Department of Natural Resources Culvert Inventory Application Suite is a crowdsourcing set of tools that collects culvert and bridge data across the state of Minnesota. The suite includes a mobile application, a central ArcSDE database, and a web application with online maps. Its design allows simultaneous collection of feature locations and attributes in a standardized manner by multiple users. The inventoried information serves a variety of purposes, including LiDAR-derived DEM modeling and digital dam removal; fish migration-barrier documentation and species enrichment; stream geomorphology and floodplain hydrology revitalization. The Collector for ArcGIS Mobile Application of the suite works on any handheld device for in-field collection of culvert locations, onsite images, and feature attributes. A single master control point represents each inventoried bridge and culvert feature. A set of paired points digitized at the inlet and outlet of culverts link spatially to the master control point that carries unique attributes for single or multiple culverts. With wireless connectivity, these georeferenced data collected in the field upload directly to a centralized ArcSDE database supported by real-time editing. Built upon the ArcGIS Online web application interface, data stewards can conduct in-office review, editing, and approval of their data locations and attributes created in the field. This feature provides an opportunity to incorporate local knowledge of features into the database strengthening earlier field work. Minnesota's premier spatial distribution portal, the GeoSpatial Commons hosts approved data for end-user consumption. The resulting database will improve government's efficiency and effectiveness in protecting the safety of citizens, enhancing the quality of water, and conserving aquatic habitats. This presentation will demonstrate the effectiveness of a crowdsourced Culvert Inventory Application Suite for Minnesota with an element geared towards how organizations outside of Minnesota can use the suite of applications as a template for their own business needs.
