Introduction

GIS for Science: A Framework and a Process—Jack Dangermond and Dawn J. Wright, Esri	viii
Introduction by the Editors—Dawn J. Wright and Christian Harder, Esri	ix
GIS Science Response to the COVID-19 Outbreak—Esri Staff	x
Why Geography Still Matters—Jared Diamond	xxiv

Part 1: How Earth Works 2

The Geography of Islands —Roger Sayre, Madeline Martin, Jill Cress, US Geological Survey; Nick Holmes, The Nature Conservancy; Osgur McDermott Long, Lauren Weatherdon, UNEP World Conservation Monitoring Center; Dena Spatz, Pacific Rim Conservation; Keith VanGraafeiland, Esri; and David Will, Island Conservation	4
Islands come in all shapes, sizes, and types, from tiny rocky outcrops to enormous continental landmasses. The true number of islands distributed in the planet’s seas and oceans is still elusive. Recent efforts, bolstered by an abundance of detailed satellite imagery and the sophistication of geographic information systems (GIS), are bringing answers to those questions closer than ever.	

Unlocking Ocean Intelligence —Lisa C. Wickliffe, Seth J. Theuerkauf, Jonathan A. Jossart, Mark A. Finkbeiner, David N. Stein, Christine M. Taylor, Kenneth L. Riley, and James A. Morris, Jr.	22
With a veritable deluge of new data sources for oceans coming online from satellites, shipboard surveys, and autonomous systems, transforming raw data into meaningful information has emerged as a crucial need for marine industries and management across a broad spectrum of communities. The National Oceanic and Atmospheric Administration and Bureau of Ocean Energy Management have successfully deployed an advanced geographic information systems platform to unleash the power of spatial analytics to unlock ocean intelligence.	

The Geography of Ocean Plastics —Orhun Aydin and Shaun Walbridge, Esri	38
Since their invention in the 1950s, plastics have had an alarming and highly visible impact on the world’s oceans that humanity certainly never anticipated. Modern scientific detectives are turning to big data and advanced GIS software to understand the major sources of plastic pollution in the world’s oceans as a first step to reducing their presence.	

Exploring Beneath the Basemap —Jennifer Bauer, Devin Justman, MacKenzie Mark-Moser, Lucy Romeo, C. Gabriel Creason, and Kelly Rose, National Energy Technology Laboratory	50
The majority of the world’s energy and mineral resources are extracted from below ground. Subsurface geologists explore the world below land and sea through the lens of current and historical data. Using GIS and geoscience methods, scientists are redefining our knowledge of the subsurface.	

Part 2: How Earth Looks 68

Mapping Human Dynamics —Amy Rose, Eric Weber, Jacob McKee, Marie Urban, Dalton Lunga, Lexie Yang, Jessica Moehl, Melanie Laverdiere, Nagendra Singh, Mark Tuttle, Matthew Whitehead, Ashley Huff, Matt Lakin, and Budhendra Bhaduri, Oak Ridge National Laboratory	70
Researchers at Oak Ridge National Laboratory are mapping the global footprints of human activity with unprecedented spatiotemporal resolution. With a global population now approaching 8 billion people, this herculean effort demands advanced machine learning, artificial intelligence, and one of the world’s fastest supercomputers.	

Sustainable Food Production—Paul West, James Gerber, and Deepak Ray, University of Minnesota, Institute on the Environment; and Mauricio Castro Schmitz, The Nature Conservancy 84

Facing the prospect of feeding an additional 2 billion people by the year 2050 has agricultural scientists scrambling for practical and sustainable solutions. Using data from a broad range of sources, geospatial innovations are creating breakthroughs.

Tracking Global Forest Loss—Elizabeth Goldman, Nancy Harris, WRI; Lauren Bennett, Esri; and Stephen Ansari, Christopher Gabris, and Michael Lippmann, Blue Raster 98

Using big geodata, researchers at the World Resources Institute are using advanced geospatial tools and data frameworks to better monitor and model the spatial patterns of human activity in the world's remaining tropical forest landscapes.

How to Feed the World—Daniel Roberts, Bruce Vandenberg, Steven Mirsky, Michael Buser, USDA—Agricultural Research Service; Chris Reberg-Horton, North Carolina State University—Center for Environmental Farming Systems; and Nick Short and Sudhir Shrestha, Esri 110

Agricultural science is searching for more efficient and sustainable farming practices in the face of an additional 2 billion mouths to feed by 2050. Big data from new innovations in sensors, delivered within the geospatial cloud, will in turn enable a new crop of precision farming techniques and analytics.

Part 3: How We Look at Earth 124

Monitoring Air Quality in the United States—Liz Naess and Halil Cakir, EPA; and Alberto Nieto, Esri 126

Born in the midst of rising concern about harmful pollution in 1970, the US Environmental Protection Agency has since its inception focused considerable attention and resources on air quality. Using GIS, the agency's Office of Air Quality Planning and Standards compiles, synthesizes, and publishes data to guide policy that keeps the public safe and informed.

The Urban Tree Canopy—Jarlath O'Neil-Dunne, University of Vermont; Dexter Locke and J. Morgan Grove, US Forest Service; and Michael Galvin, SavATree 140

In dense urban centers, a city's treescapes (or lack thereof) have a big impact on the quality of life. A unique government and academic partnership uses lidar and GIS technology to help communities map, assess, and monitor their urban tree canopy.

Monitoring Disasters—Jeremy Kirkendall and Garrett Layne, NASA Disasters Program 150

Responding to major natural and human-caused hazards, the NASA Earth Applied Sciences Disasters Program collects, synthesizes, and shares data collected from dozens of Earth-orbiting satellites.

Environmental Monitoring with Drones and GeoAI—William Shuart, Virginia Commonwealth University; and Rohit Singh, Lain Graham, and Gerald Kinn, Esri 168

The blue catfish is an invasive species that is wreaking havoc in the Chesapeake Bay. Scientists are using drone imagery, artificial intelligence (AI), and GIS as they probe to understand the full scope of the problem.

Part 4: Technology Showcase 180

The Spilhaus World Ocean Map	182	Sea-Surface Temperature Trend Mapping	194
COVID-19 Dashboards	184	Space-Time Pattern Mining	196
Exploring Spatiotemporal Patterns	186	Time in Spatial Scientific Workflows	198
Modeling Relationships Using Link Analysis	188	Accessing Scientific Data in the Cloud	200
Smart Mapping and Arcade	190	Drones and Citizen Science	202
Deep Learning in Disaster Management	192	Stepping Up with Voxels	204
