ArcGIS API for JavaScript: Building apps with ES Modules

René Rubalcava

@odoenet

2021 ESRI
DEVELOPER SUMMIT

Agenda

- Why ES Modules?
 - ESM CDN
 - Assets
 - Import Syntax
 - Build Tools
- 

What are ES Modules?

Modern way of writing modular JavaScript

```
npm i @arcgis/core
```

```
// old and busted  
require(['esri/WebMap'], function(WebMap) {...});  
  
// new hotness  
import WebMap from '@arcgis/core/WebMap';
```

Why does it matter?

- Ideal for modern web development
- Supported in evergreen browsers
- Works with modern build tooling
 - webpack, rollup, snowpack, and more

Getting Started

Prototyping with ESM CDN

- *NOT FOR PRODUCTION*
 - Great way to test out some ideas
 - Native browser module loading
- 

Prototyping with ESM CDN

```
<script type="module">
  import ArcGISMap from "https://js.arcgis.com/4.18/@arcgis/core/";
  import MapView from "https://js.arcgis.com/4.18/@arcgis/core/viewer";

  const map = new ArcGISMap({
    basemap: 'topo-vector'
  });

  const view = new MapView({
    container: 'viewDiv',
    map,
    zoom: 4,
    center: [-118, 34]
  });
</script>
```

- demo

Assets

*you need to copy the
@arcgis/core/assets folder to
your build directory*

- for webpack, the @arcgis/webpack-plugin can do this for you.

Assets

- a few ways to copy assets
- `ncp` - cross-platform copy tool

```
// package.json
{
  "script": {
    "copy": "ncp ./node_modules/@arcgis/core/assets ./public/"
    "postinstall": "npm run copy"
  }
}
```

- webpack and rollup have copy plugins

Assets

- Does your app use *routing*?
- App isn't hosted in the root of your domain

```
import config from '@arcgis/core/config';  
config.assetsPath = 'https://username.github.io/myrepo/dist/asset'
```

Import Syntax

```
// avoid this
import * as geometryEngine from '@arcgis/core/geometry/geometryEn

// only load what you need
import { buffer, intersect } from '@arcgis/core/geometry/geometry'
```

Import Syntax

```
// avoid this
import * as watchUtils from '@arcgis/core/core/watchUtils';

// only load what you need
import { whenFalseOnce, whenDefined } from '@arcgis/core/core/wat
```

webpack

webpack builds

```
// webpack.config.js
const ArcGISPlugin = require('@arcgis/webpack-plugin');

module.exports = {
  ...
  plugins: [
    new ArcGISPlugin(),
    ...
  ]
};
```

rollup

rollup builds

```
// rollup.config.js
import commonjs from "@rollup/plugin-commonjs";
import del from "rollup-plugin-delete";
import resolve from "@rollup/plugin-node-resolve";

export default {
  input: "src/main.js",
  output: {
    chunkFileNames: "chunks/[name]-[hash].js",
    dir: "public",
    format: "es"
  },
  plugins: [
    del({ targets: "public/chunks", runOnce: true, verbose: true }),
    resolve(),
    commonjs()
  ]
}
```

snowpack

snowpack builds

```
// snowpack.config.js
module.exports = {
  mount: {
    // does not copy,
    // but prevents snowpack from trying to parse
    // worker and web assembly files
    "node_modules/@arcgis/core/assets": {
      url: "/assets", static: true,
      resolve: false
    },
    "src": "/",
  },
  plugins: [["@snowpack/plugin-webpack"]]
};
```

webpack module federation

- Dependency sharing
- Dynamically import code from another at runtime

Tip

- You may not want to copy assets folder.
- You can load assets from an external source
- *Make sure versions match*

```
import config from '@arcgis/core/config';  
config.assetsPath = 'https://cdn.jsdelivr.net/npm/arcgis-js-api@4
```

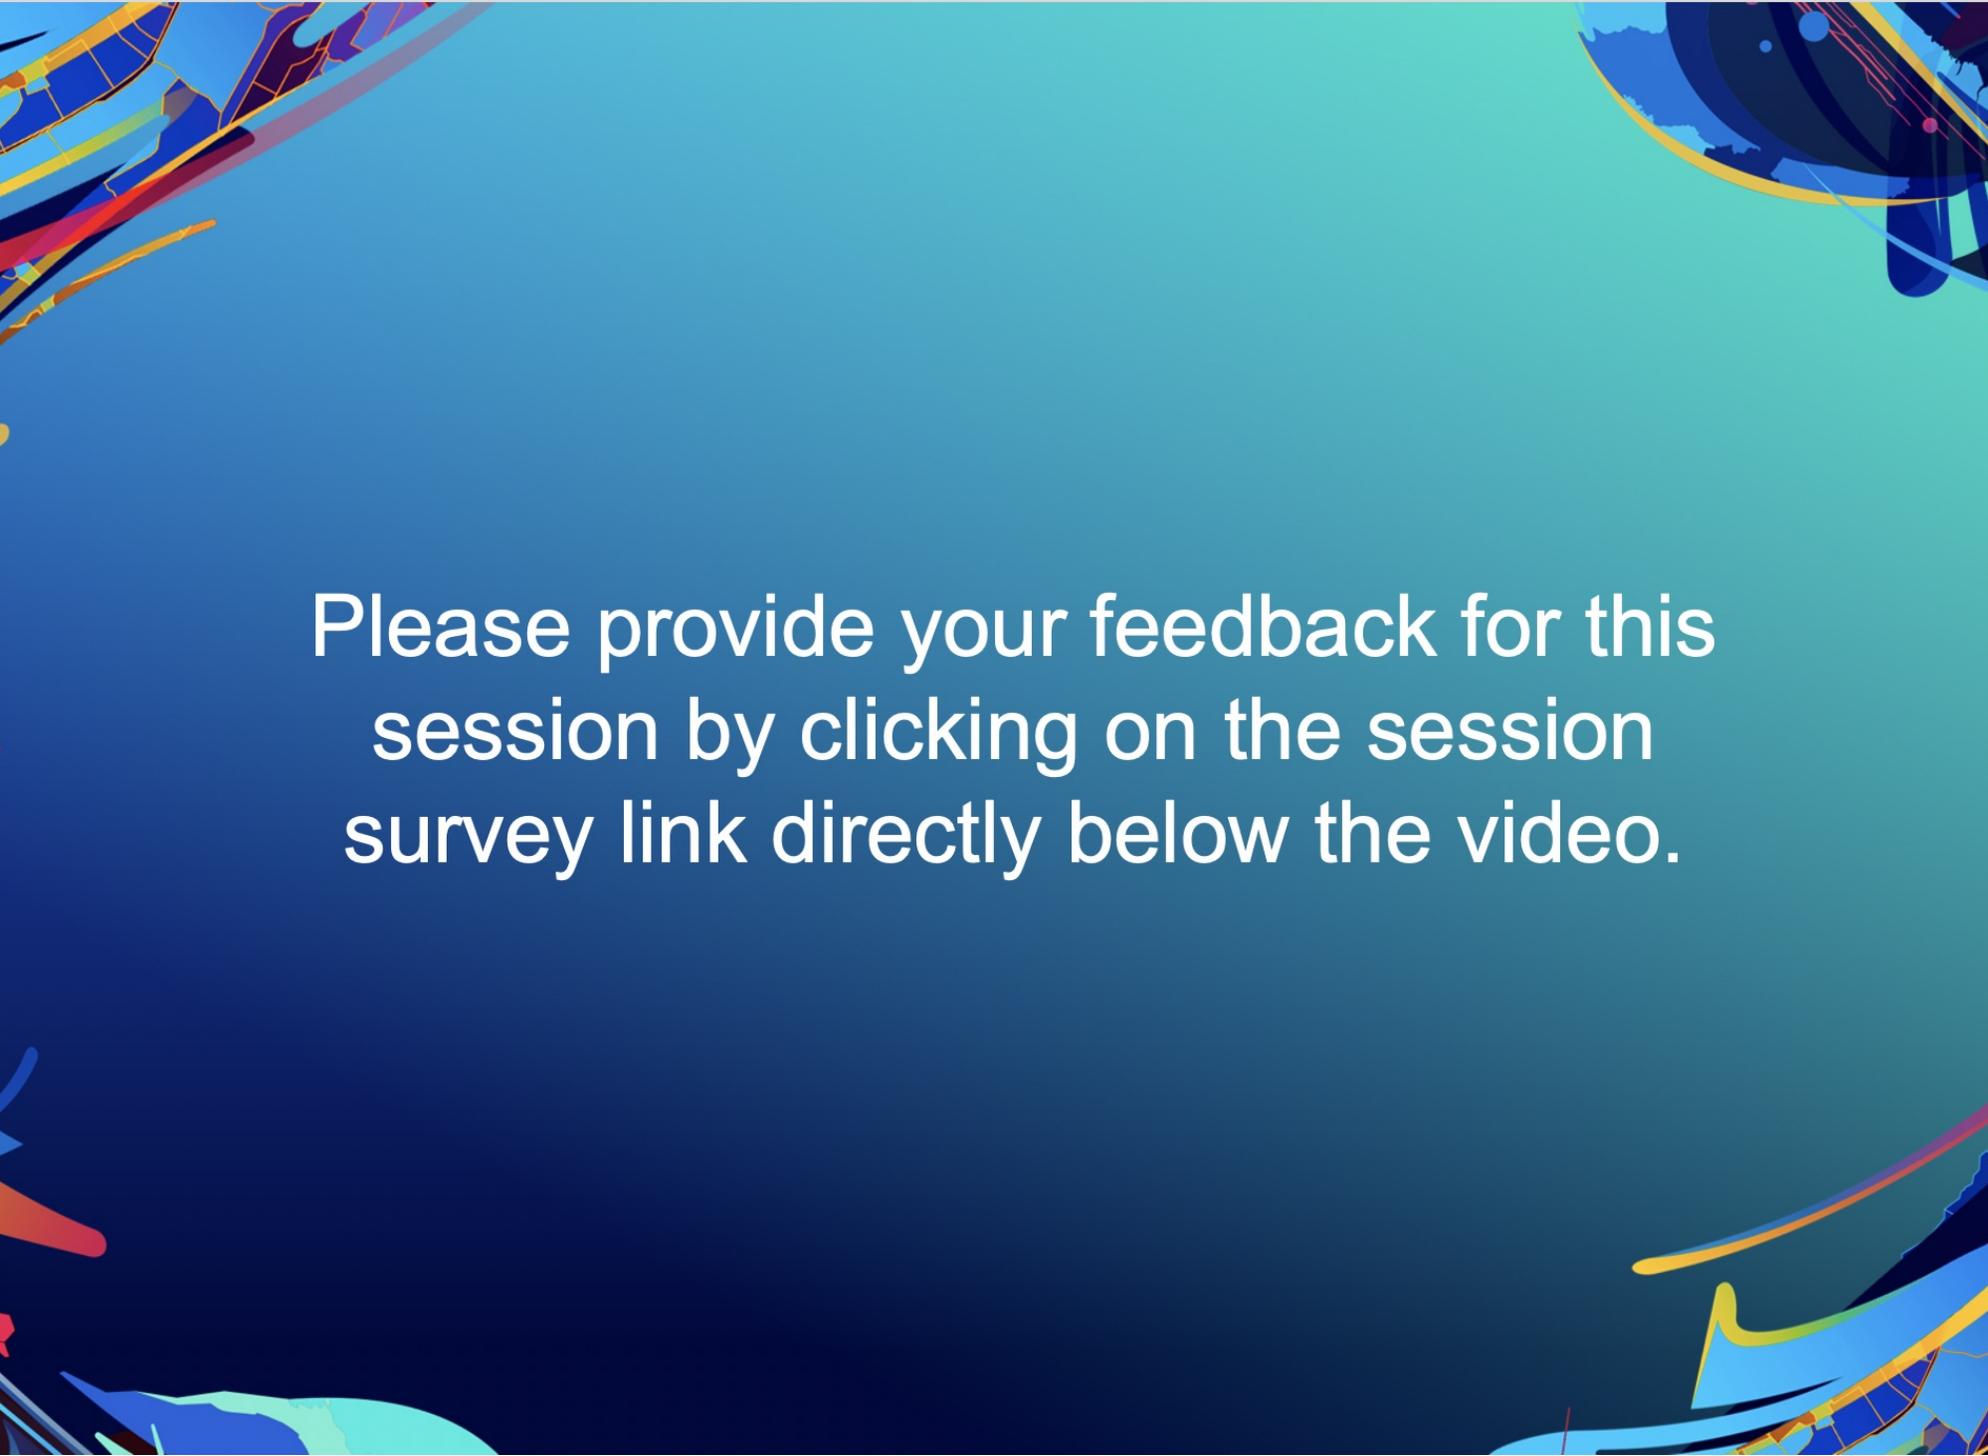

Summary

esri

**THE
SCIENCE
OF
WHERE**

The background is a gradient of blue and teal. There are abstract, colorful geometric shapes in the corners, including blue, yellow, red, and purple lines and curves. The text is centered in the middle of the slide.
