

# Spatial Data Science: Time Series Analysis

Lauren Bennett, PhD

Alberto Nieto

Flora Vale

2021 ESRI FEDERAL GIS CONFERENCE

# Space Time

# Pattern Mining

Toolbox to analyze spatiotemporal data

# Creating a Space Time Cube

Aggregating in space and time

# Time Series

# Clustering

Identifying similarities in values and changes

# time series

# cluster by value

# cluster by profile

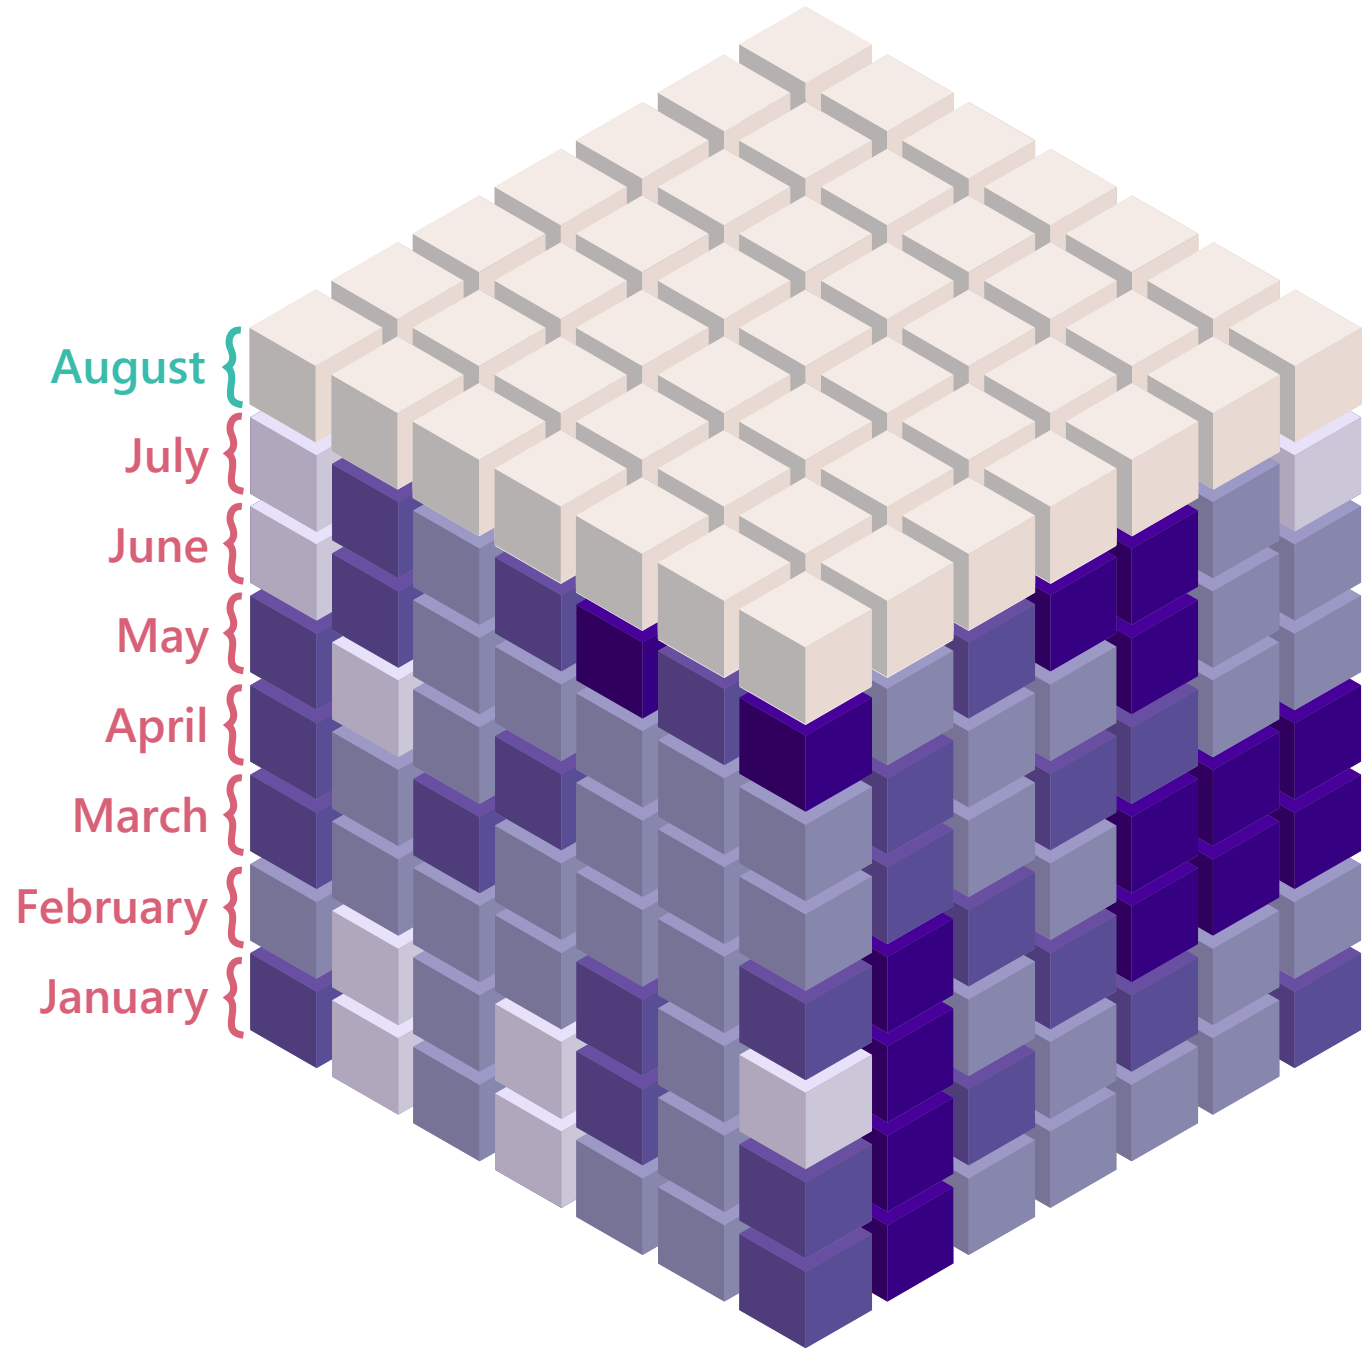

# Time Series

# Forecasting

Predicting using time series

how do we  
estimate  
values for  
the next  
time step?

# Three tools to do time series forecasting

**Curve Fit Forecast**

**Exponential Smoothing**

**Forest-based Forecast**

## Curve Fit Forecast

- Simplest method to run and interpret
- Auto-detect option
- Not for seasonal or complex patterns

## Exponential Smoothing

- Detects trends and seasons
- Tried and true method in academia
- Creates confidence intervals

## Forest-based Forecast

- No assumptions about data structure
- Can capture more complicated shapes and trends
- Forecast result is difficult to interpret

# model *validation*

# Time Series Forecasting

Curve Fit Forecast

Exponential Smoothing Forecast

Forest-based Forecast

Evaluate Forecasts by Location
