

Assessing flood impacts using a multi-scale geospatial database model

Presenters

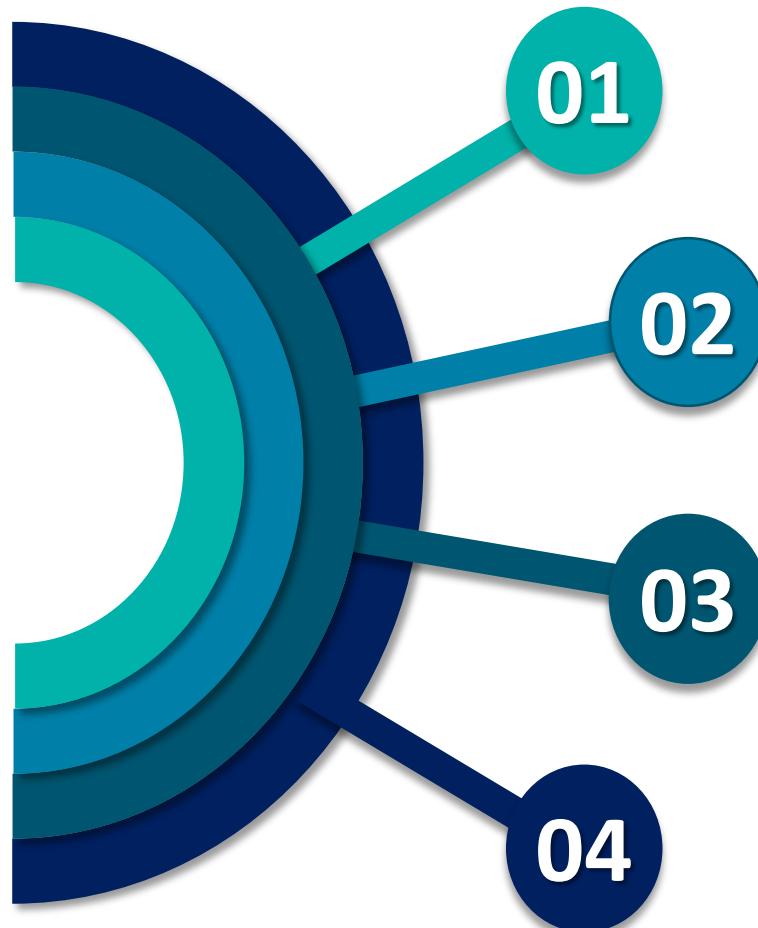

Professor of Earth Systems Engineering

PhD student, EPSRC Centre for Doctoral Training in Geospatial Systems

Flooding in the UK

Need for geospatial framework for managing impact of flooding

Esri technology stack in use

Benefits of integrated model

Flash flooding, river flooding, coastal flooding, surface water flooding...

2.6 billion
£

2.4 million buildings are
at risk of flooding from
rivers or the sea

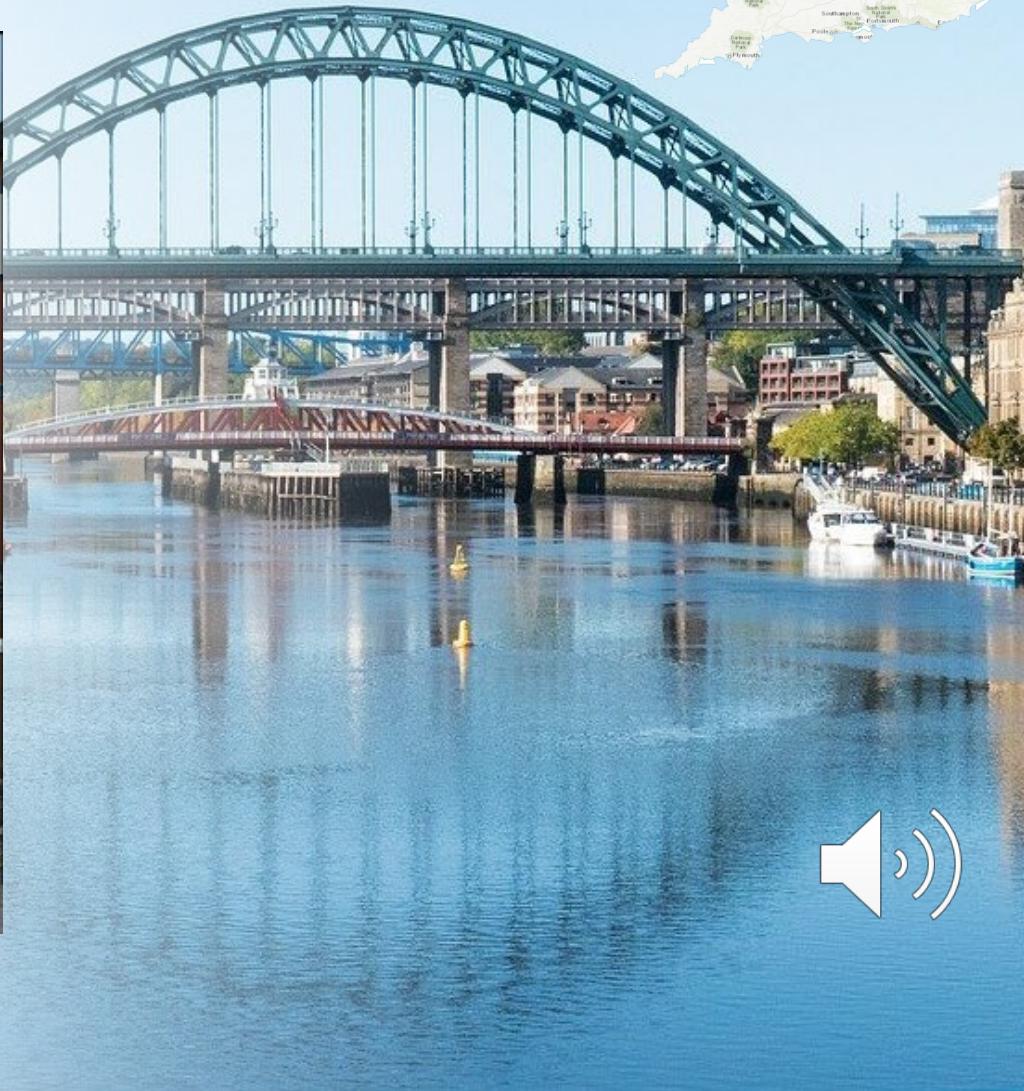

2.8 million buildings are
at risk of flooding by
surface water

Costs for flood
damage in the UK
since 2011

Newcastle upon Tyne (UK)

Flooding: Toon Monsoon (June 2012)

Summers, M., 2012, The Northern Echo: Roads turn to rivers in a flash as thunderstorms hit region,
Url = <https://www.thenorthernecho.co.uk/sport/9788748.roads-turn-rivers-flash-thunderstorms-hit-region/>, Visited: June 2020.
Hardisty, A., 2012 Newcastle Floods 28/06/2012, Url = https://www.youtube.com/watch?v=Afm3_WUqlc, Visited: June 2020.

Complexity of urban environment

Infrastructure

Roads

Buildings

Providing data, responsible for tasks during different stages of flooding, dealing with flood impacts

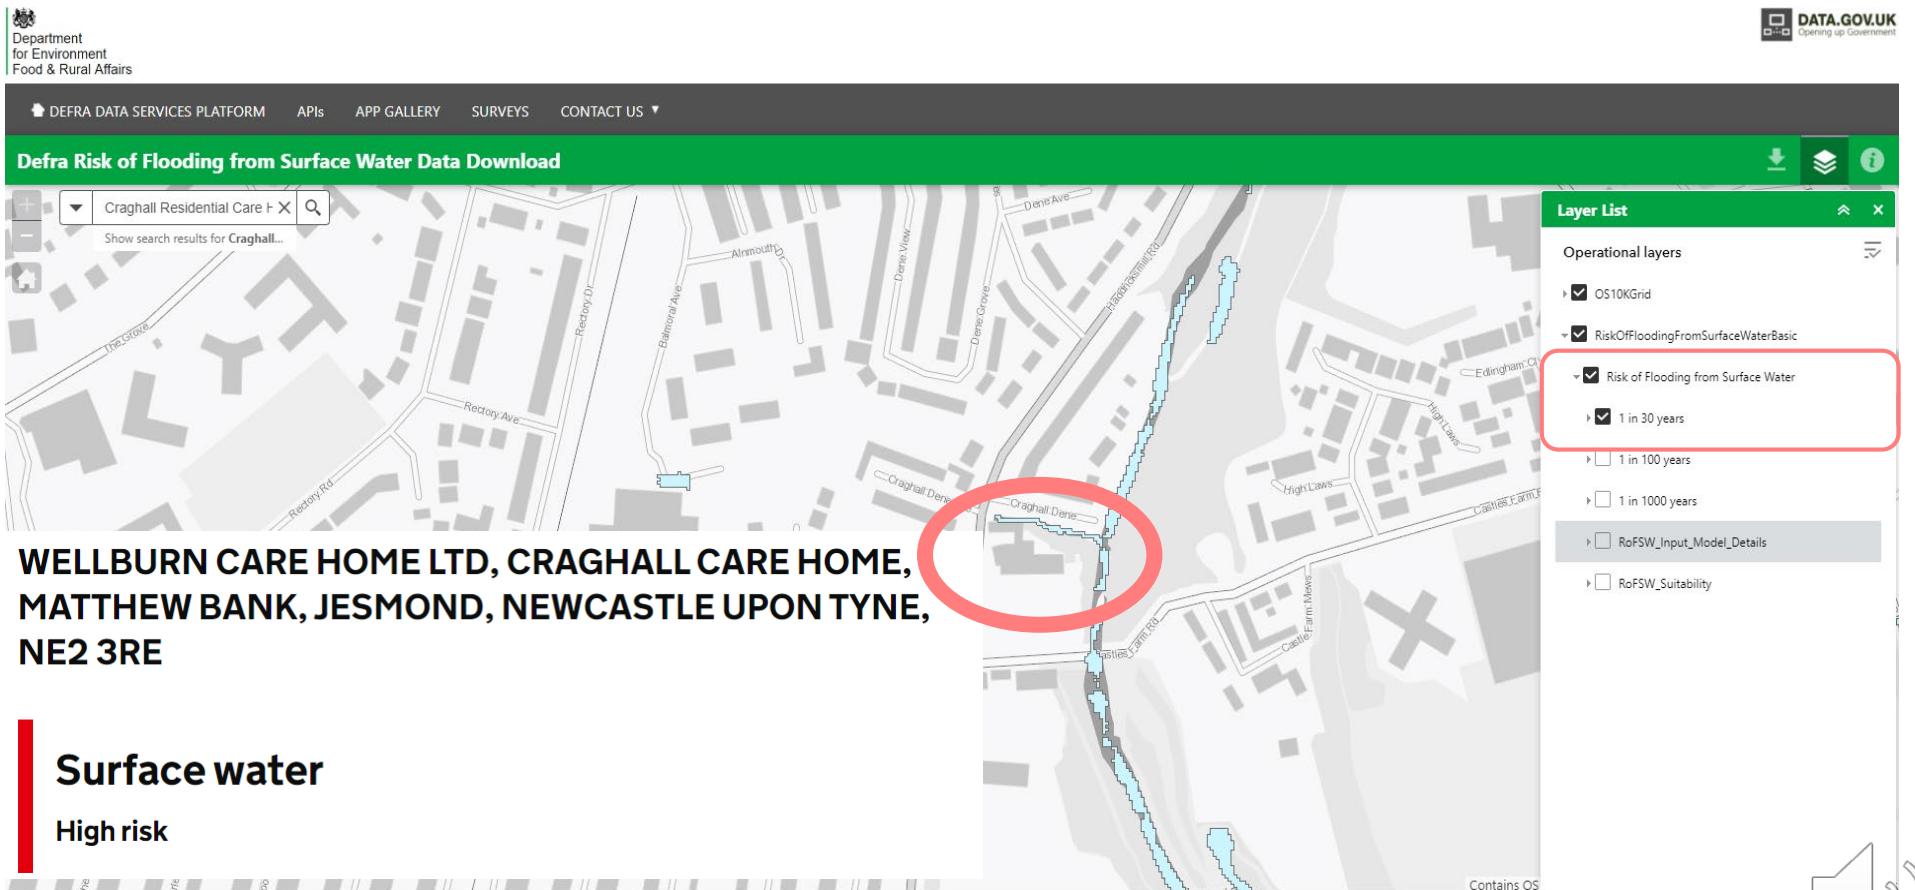

Example: Risk of surface water flooding

Flood extent

Flood velocity

Flood depth

Example: Flood warnings for England

Show warnings near a location

Q

1

Severe flood warnings

Severe flooding - danger to life

251

Flood warnings

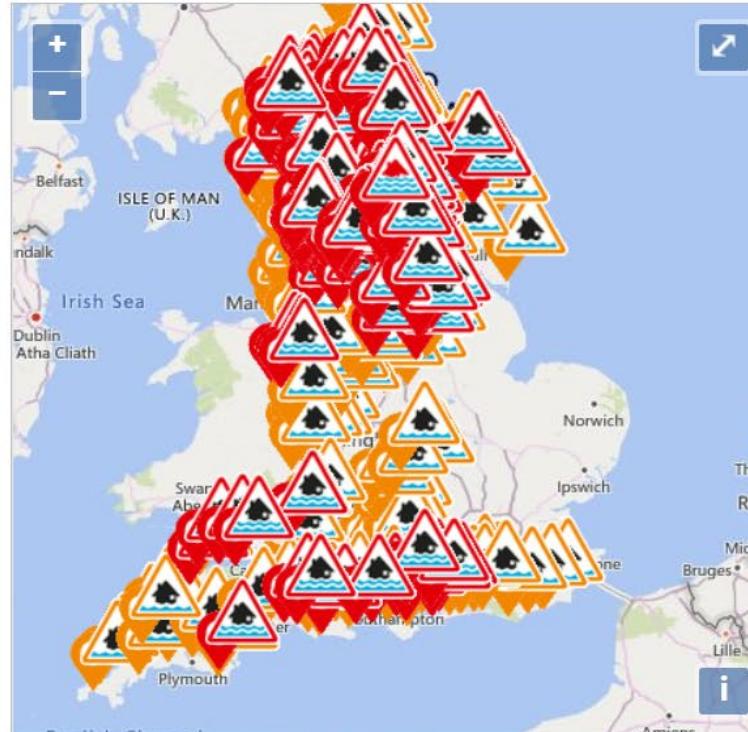

Flooding is expected - immediate action required

186

Flood alerts

Flooding is possible - be prepared

Enable to answer the following questions:

Is my house within the flood zone?

Are flood alerts issued for my area?

Enhance to answer the following questions:

How many vulnerable neighbours require special assistance?

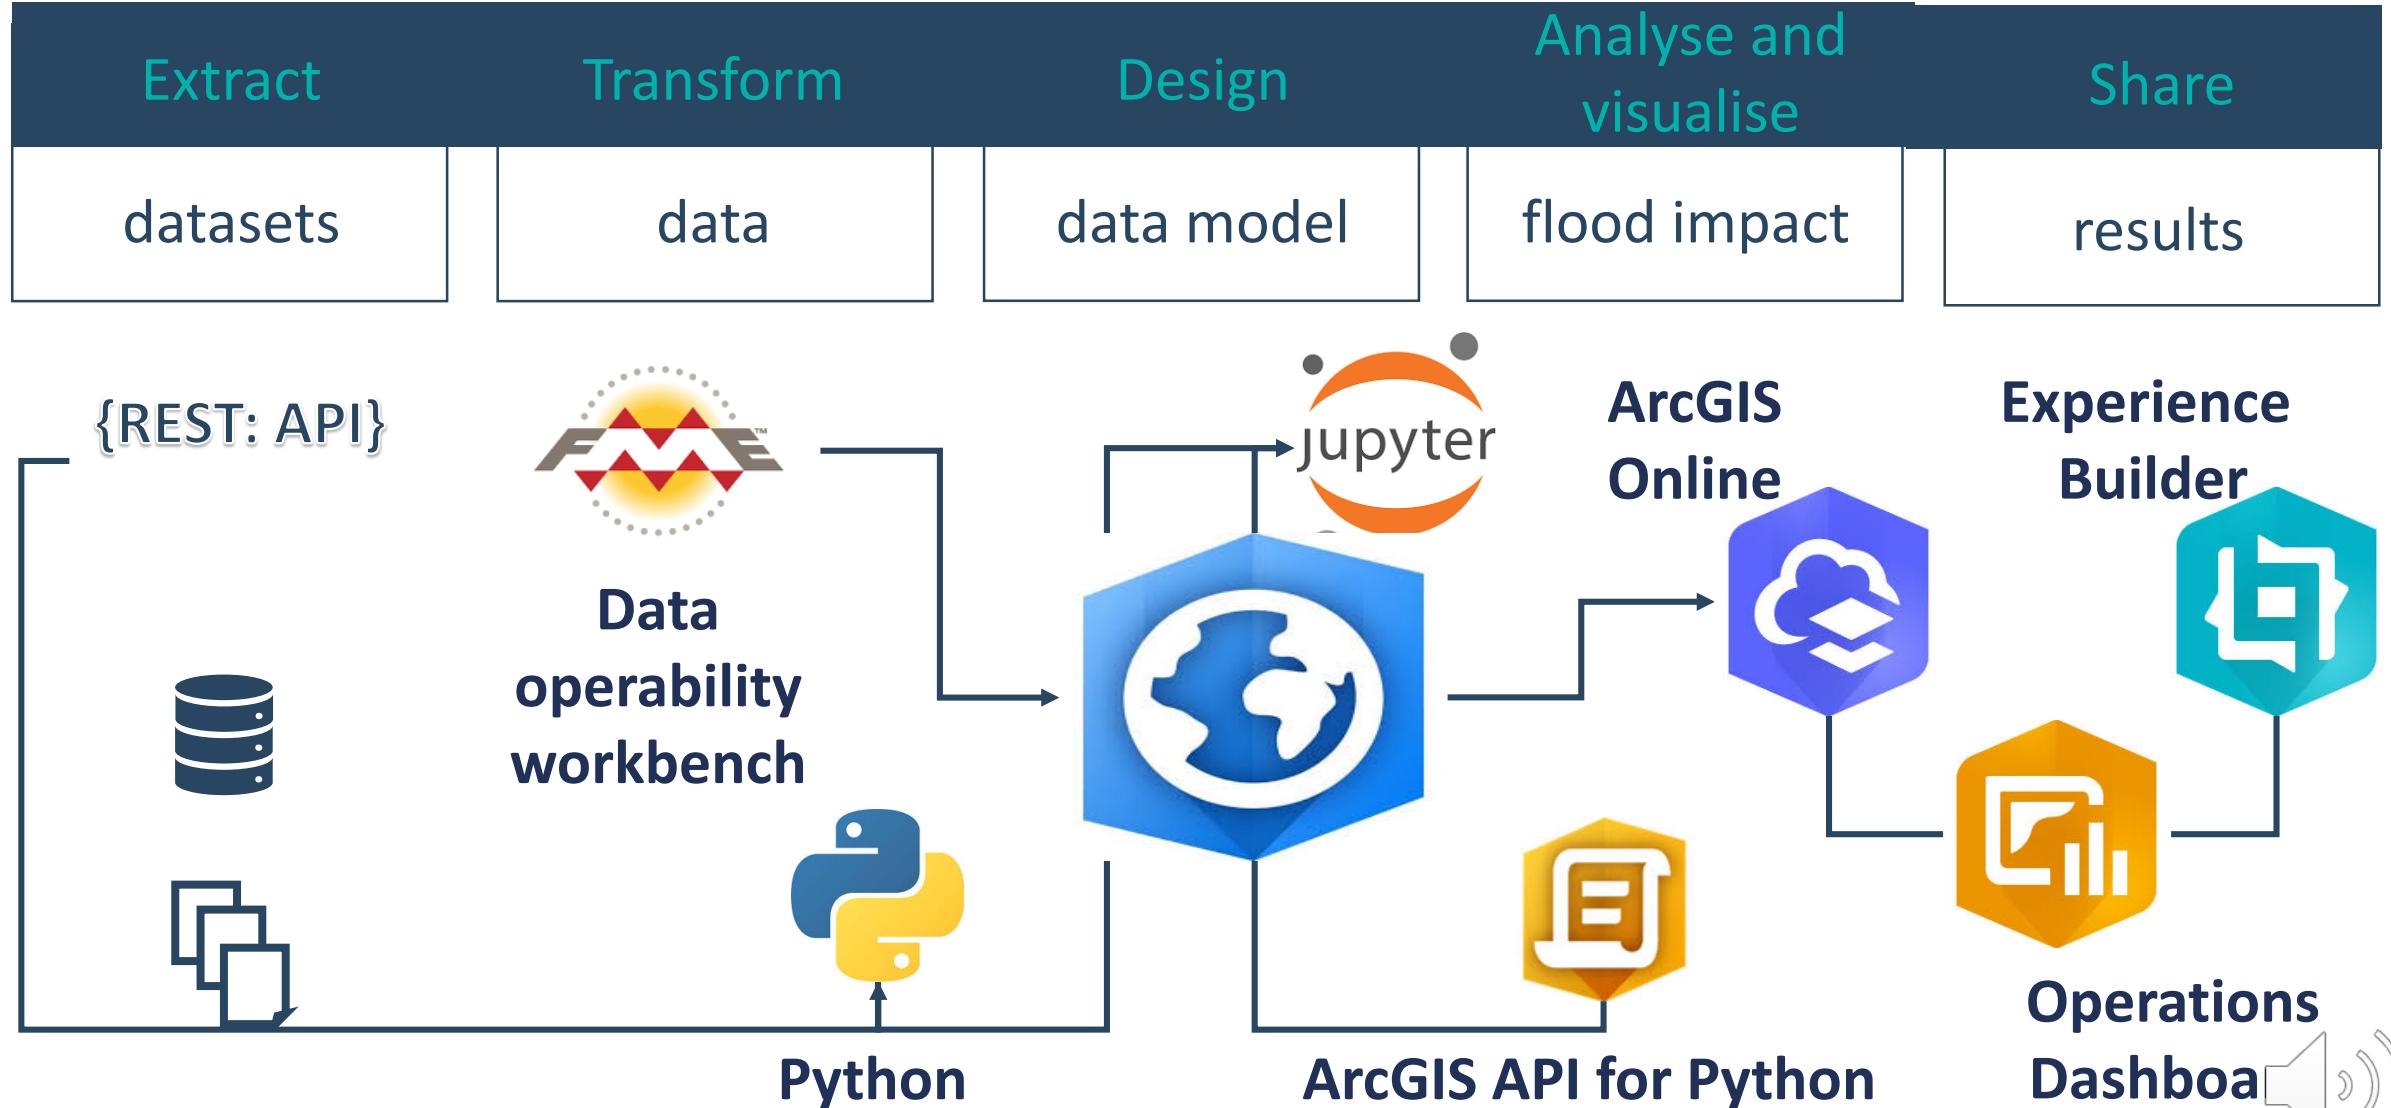

Which roads are blocked due to flooding?

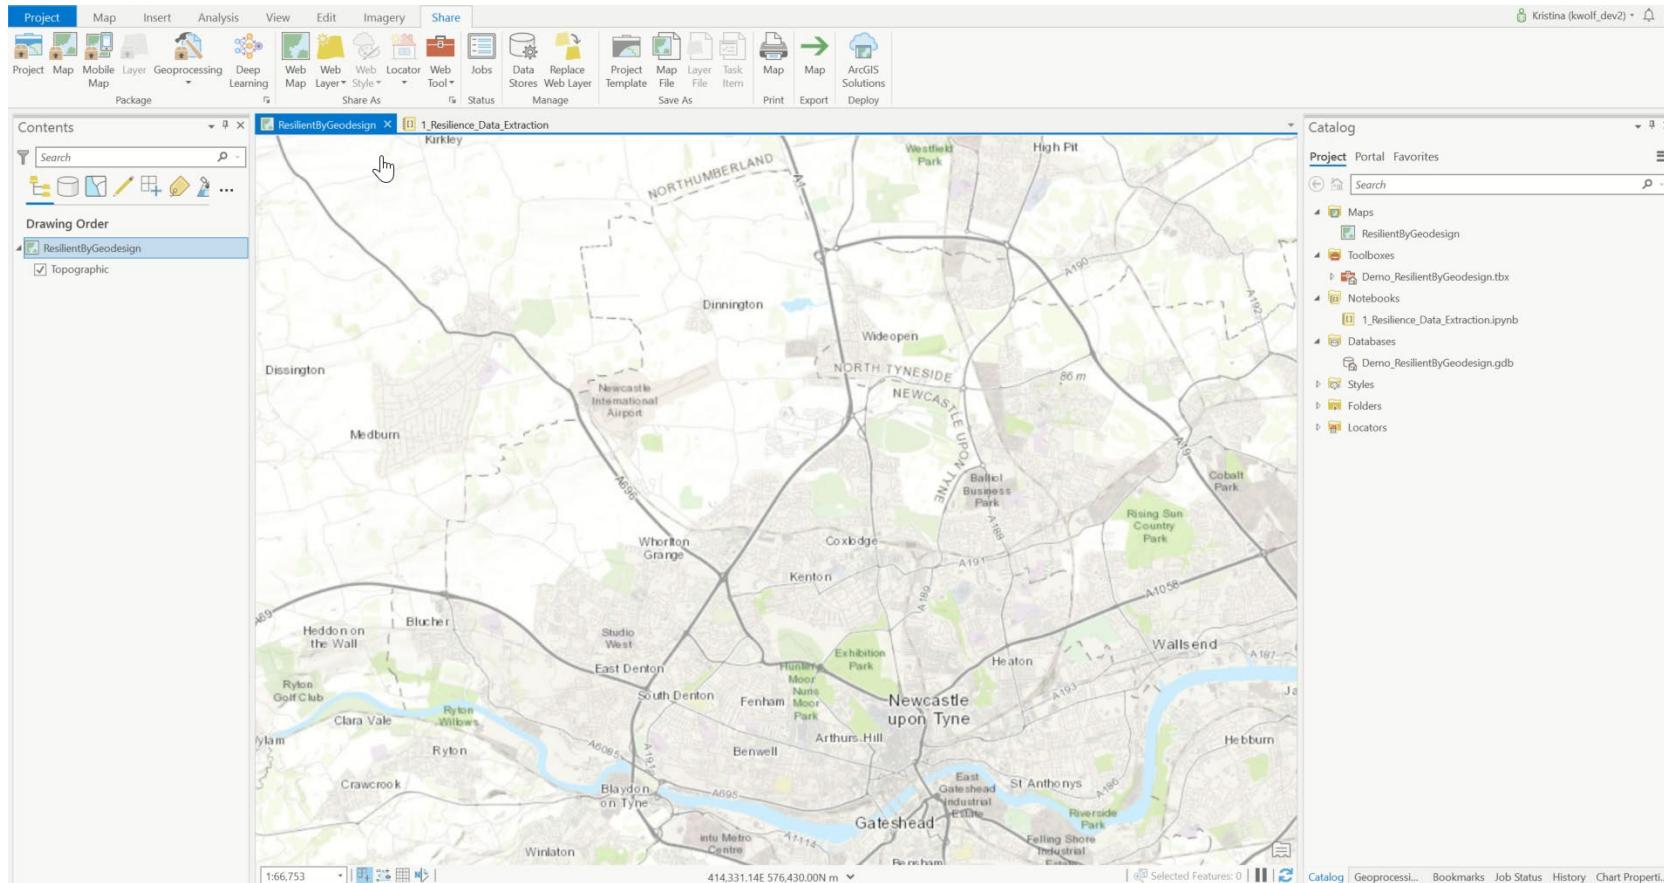

Develop a **flood geospatial database** model for
heterogeneous data from different sources
to assess the **impact of flooding** on the
environment, society and **infrastructure**.

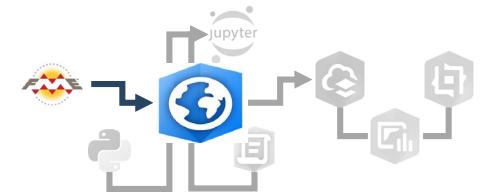

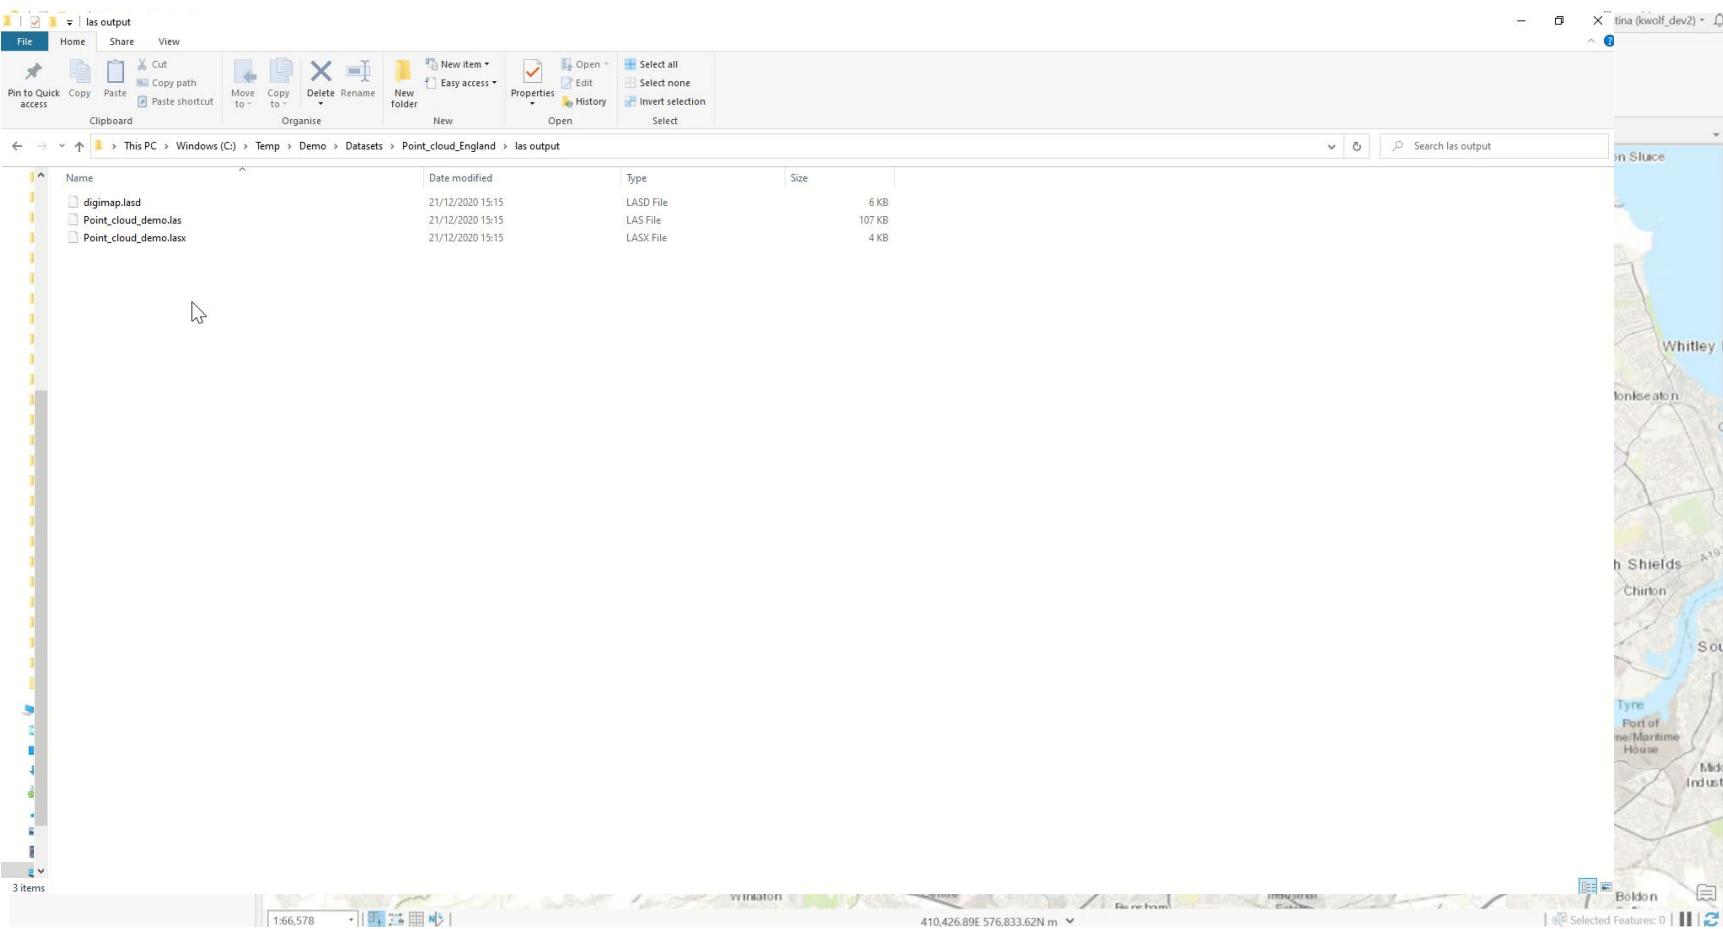

Using Jupyter Notebook to extract data and enrich with administrative hierarchical information

Using FME to convert between different data formats in an automated way

Integrating static and dynamic real-time data

Environment

Rainfall

Society

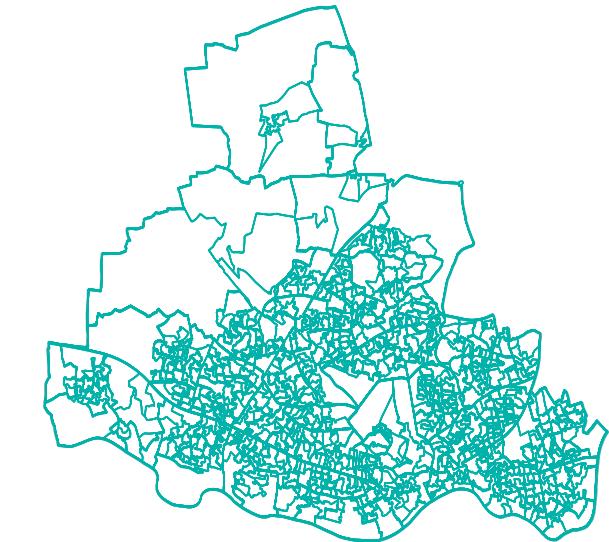

River level

Infrastructure

Incidents

Newcastle

MSOA

LSOA

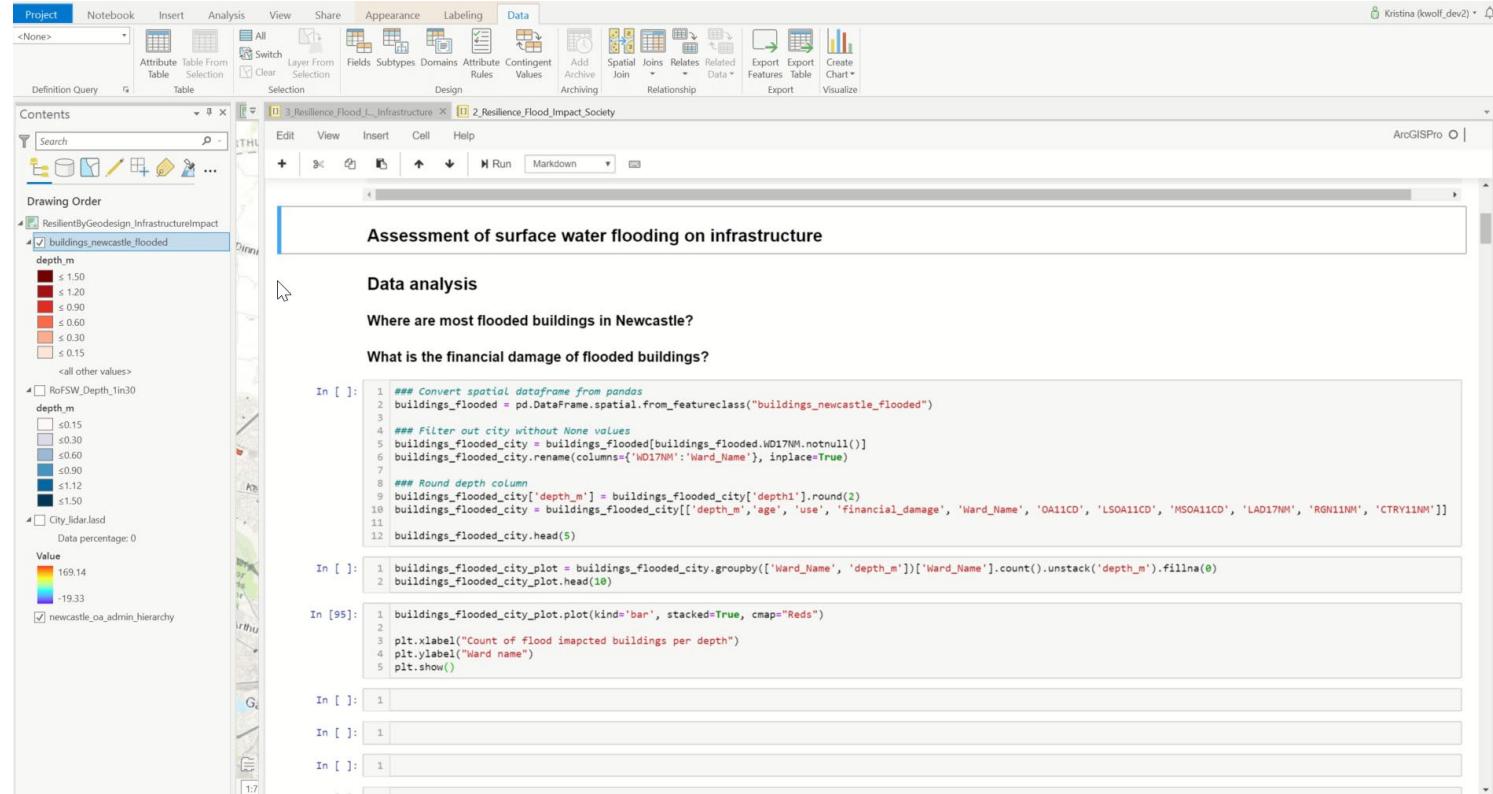

OA

... for improved flood impact assessment
at different scales.

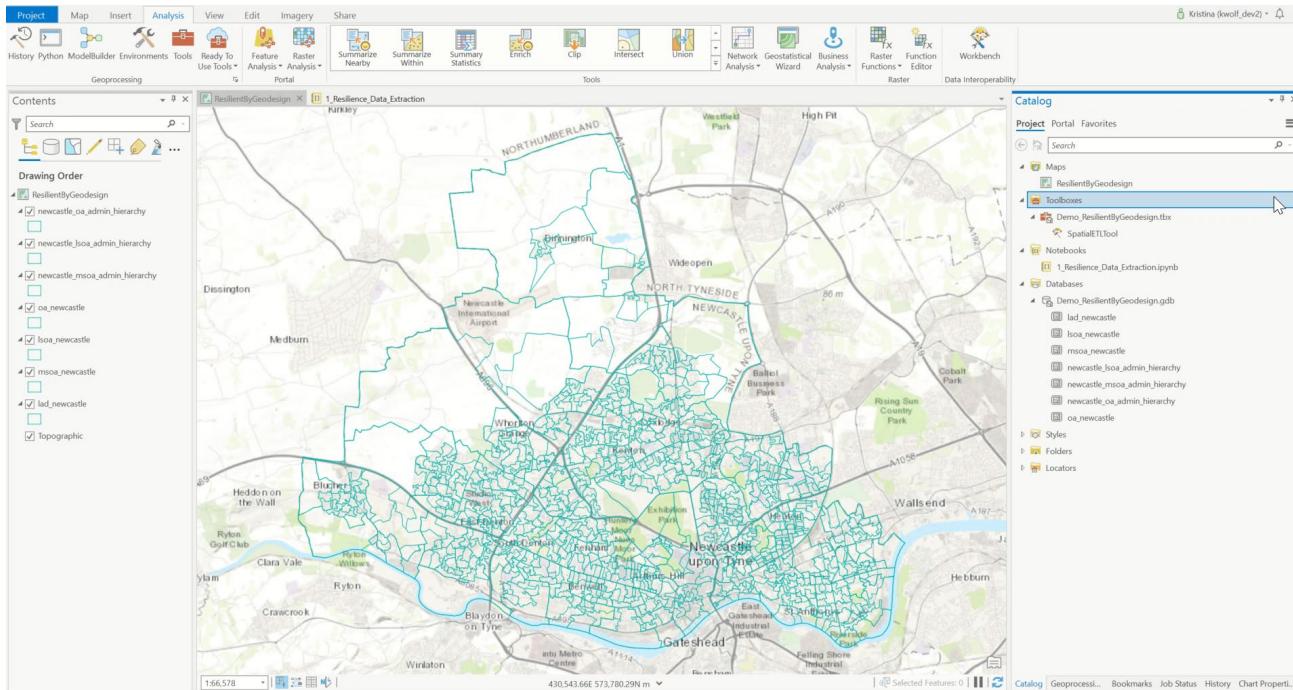

Using spatial queries to analyse flood impact

Update (online) data through scheduled script

River level

Daily accumulated rainfall

Temperature

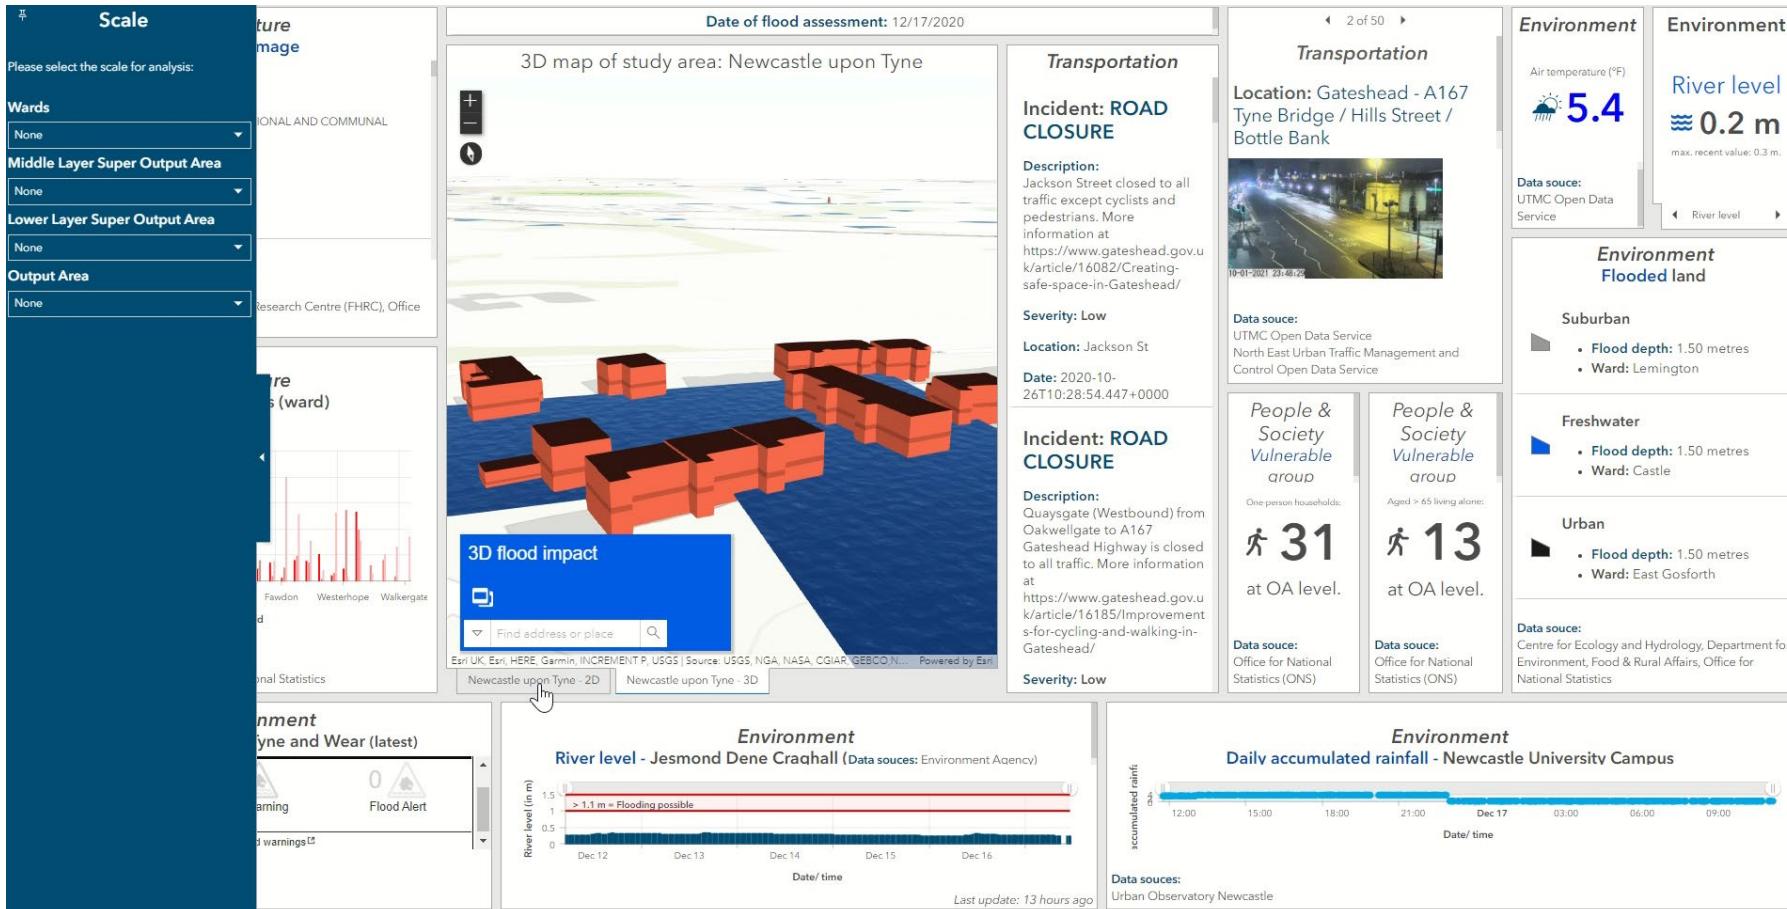

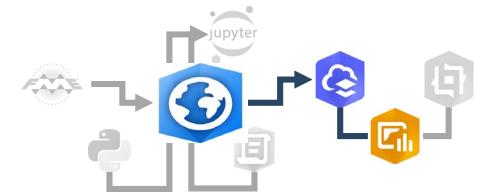

CCTV images

Incidents

Accidents

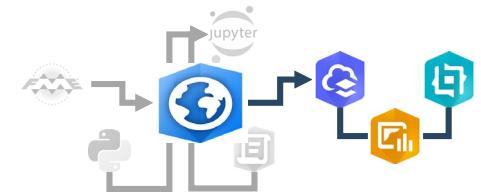

Using Operations Dashboard to visualise assessment of flooding on environment, society and infrastructure

Using Experience Builder to share project story

Assessing flood impacts in Newcastle upon Tyne (UK)

Background Research aim Analysis Contribution

Assessing flood impacts using a multi-scale geospatial database model for Newcastle upon Tyne (UK)

CDT Geospatial Systems | Kristina Wolf

Research themes:

- Background: Study of flooding
- Methodology: Geospatial database model
- Analysis: Flood impacts
- Visualisation: Flood impacts

Go to Go to Go to Go to

The integrated flood database model enables

Integration of **heterogenous data** for improved flood risk assessment and **decision support** (multiple organisations)

Quick location **overview** of different city conditions through **shared analysis of common data**

Standardised, automated data extraction and transformation using Python, allowing research **reproducibility and scalability**

Improving overall resilience.
