

Esri Utility Network Deployment for a Municipal Utility

Dave Pahl
Kaukauna Utilities

Len Jewell
POWER Engineers

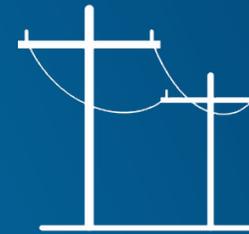

By the numbers

Founded in
1912

Over 15,000
Customers

485 Miles of
Primary Distribution Lines

Residential:
13,853

Commercial:
1,838

Industrial:
58

Services

Water

Five groundwater wells throughout the city
438 million gallons of treated water a year
100 miles of water main

Generation

Owns & operates seven hydro-electric plants
Combustion turbine plant
Member of WPPI Energy

34.5 kV Subtransmission

3 substations; 10 circuits
~15 miles of overhead line

12.47 kV Distribution

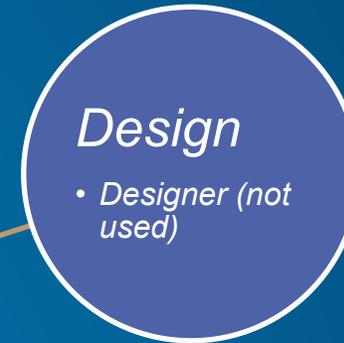

7 substations; 36 radial circuits
~174 miles of overhead line
~158 miles of underground line

Motivation

Desire to integrate GIS with other systems like SCADA

Geometric Network
End-of-Life (~2024)

Staff turnover

WindMil extract stopped working

Desire for more mobile functionality

Fix or Replace?

Questions & Concerns

How long will it take and what does it cost to convert to the UN?

How much effort will be required from KU staff?

Not a lot of UN systems in production – how risky is it?

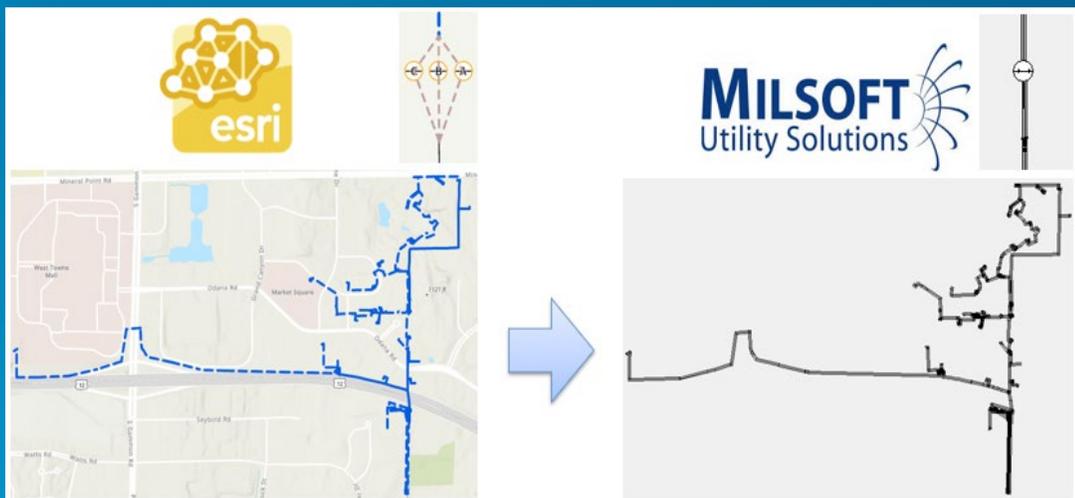

Are there tools available to extract the UN to Milsoft?

Will ArcFM still be required?

Will OMS work with the UN?

Can this be done 100% remotely?

First Steps – Selecting a Partner

esri™

Partner since 1989
(**GOLD** Level Partner)

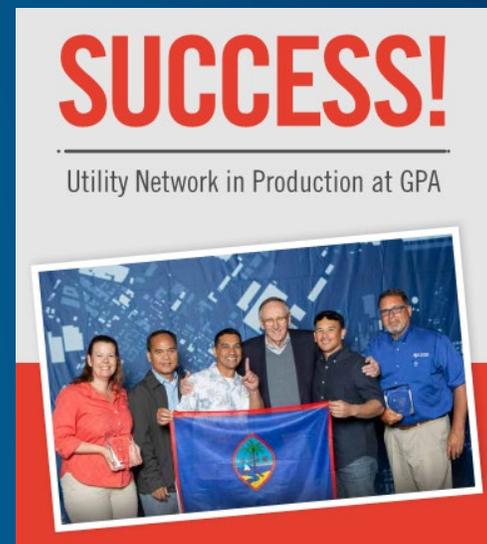

ArcGIS Enterprise Experts

Needed a partner with electric Utility Network and Milsoft WindMil experience

Utility Network Specialty badges for Electric, Water & Gas plus over a dozen similar Utility Network implementations

Esri SAG Award in 2019 for successfully converting first electric UN implementation

First Steps – Readiness Assessment

POWER's Utility Network Readiness Assessment (UNRA) has two parts:

First Steps – Readiness Assessment

- **Data Assessment is designed to answer two simple questions:**

#1 - What current GIS data doesn't fit in the standard UN data model?

#2 - How much effort will it take to get the circuits all connected with the UN connectivity rules?

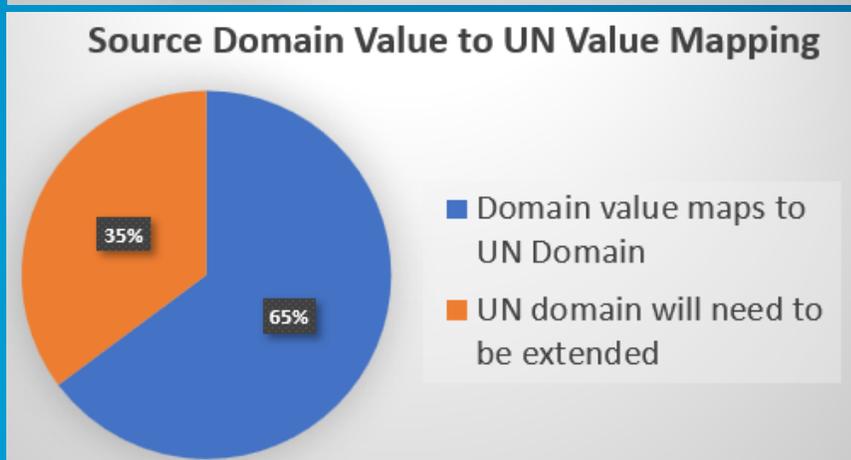

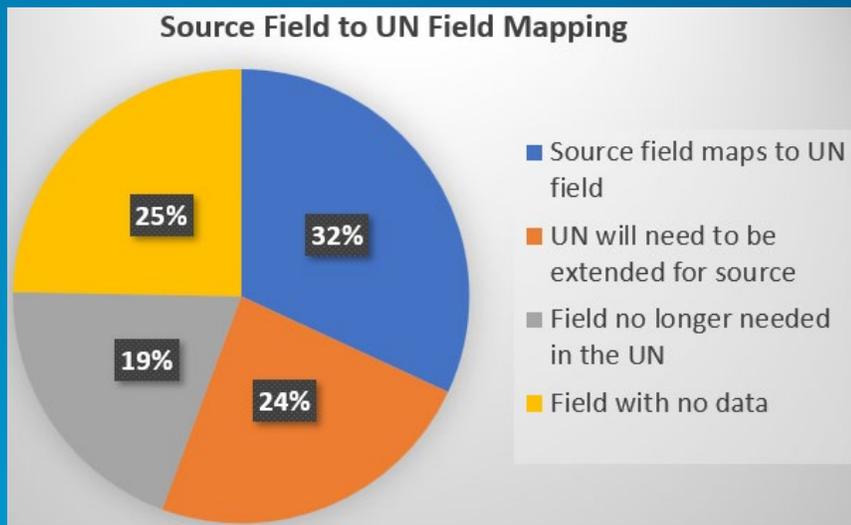

First Steps – Source Data Quality

Source Summary

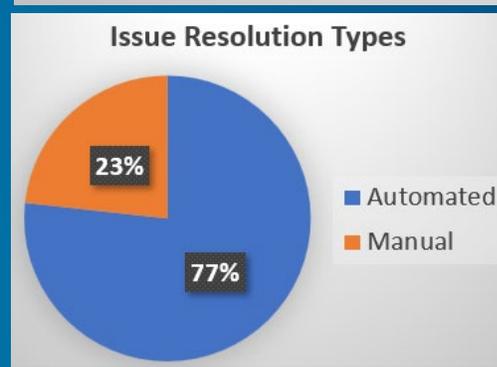

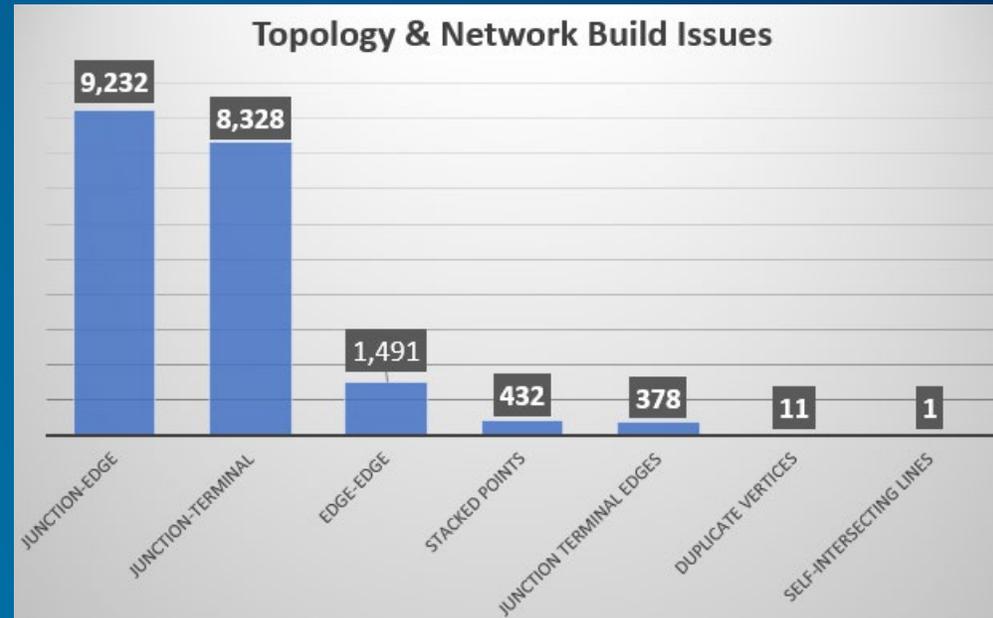

Source Data	Count
Feature Classes	25
Subtypes	69
Features	81,717
Attributes	3,381,749

Note: Schema was close to standard ArcFM and included secondaries and meters

Fit Analysis

Connectivity Analysis

Issues per Meter = 1.3

Typical Range:
0.5 (no secondaries)
2 (with secondaries)

Moving Forward – Data

Started with education on UN schema and functionality

Considerable effort went into data modeling and data mapping – more than expected

Data Conversion Statistics

Source

Item	Count
Mapped	34
Not Migrated	23
No Data	20
Just Copy	30
Total Feature Classes & Tables	107

Target

Item	Count
ElectricDevice	17
ElectricJunction	6
ElectricLine	10
StructureJunction	9
StructureLine	10
Assembly	17
ElectricDeviceUnit	10
ElectricWireData	1
JointUse	2
Service	32
Total Extended Fields	114

Domains Created	60
Domains Values Created	799

Conversions

Item	Count
Conversion Definitions	87
Source Fields Finalized	3,213
Target Sources Defined	2,329
Lookups Created	67

Conversion Fields

Item	Count
Mapped (confirmed)	1,901
Extend (confirmed)	724
Total	2,625

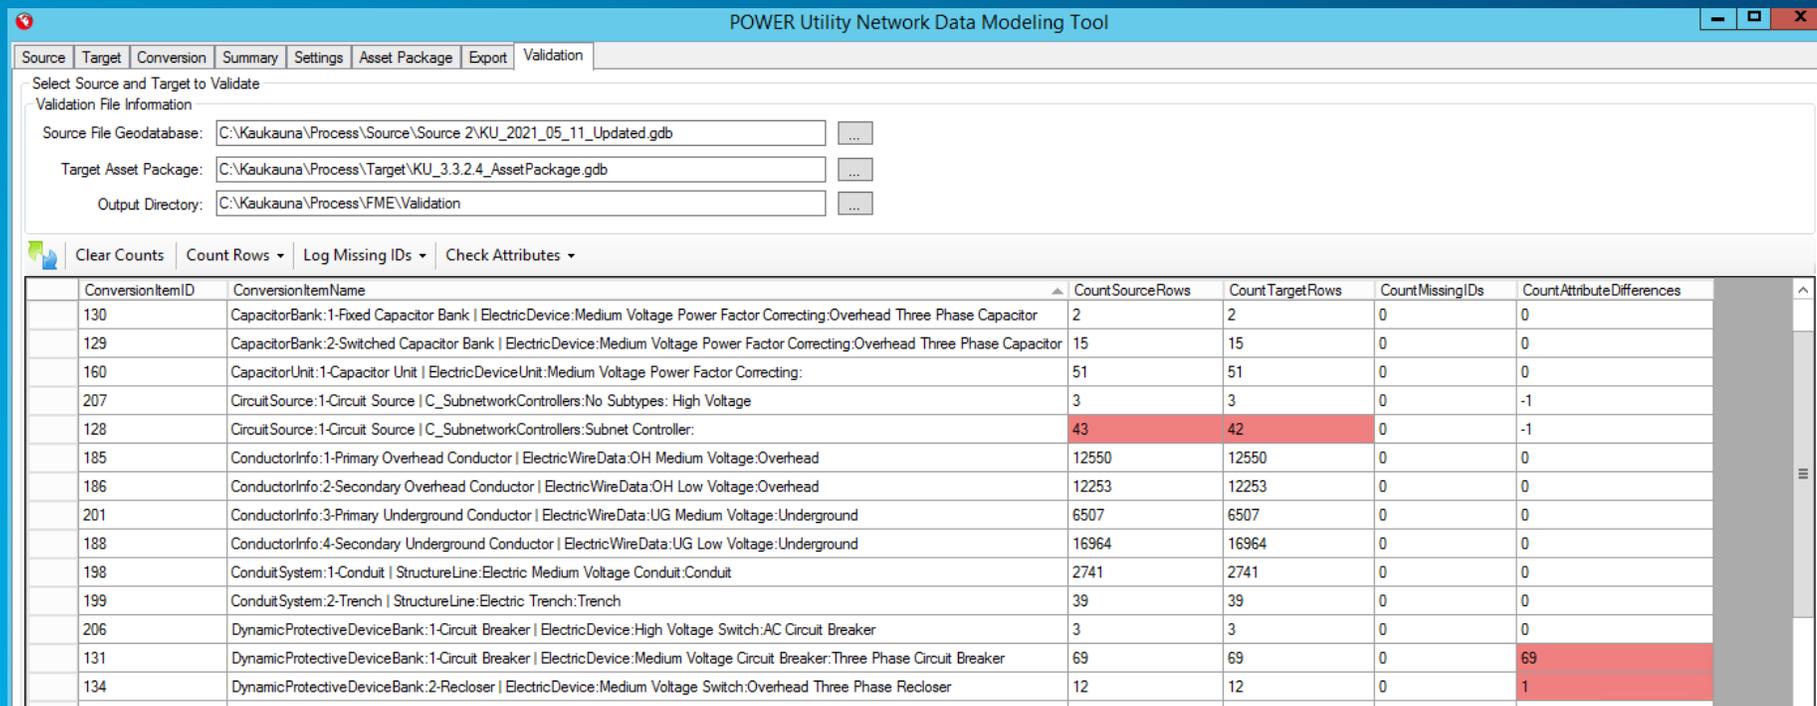

No Source (confirmed)	2,957
-----------------------	-------

Moving Forward – Data

Used a low fidelity UN data model. Needed to move and automatically connect transformers to accommodate UN Phase Propagation

Performed 3 full conversions with QA between each cycle

Used automated verification to ensure that each attribute for each object was converted as designed

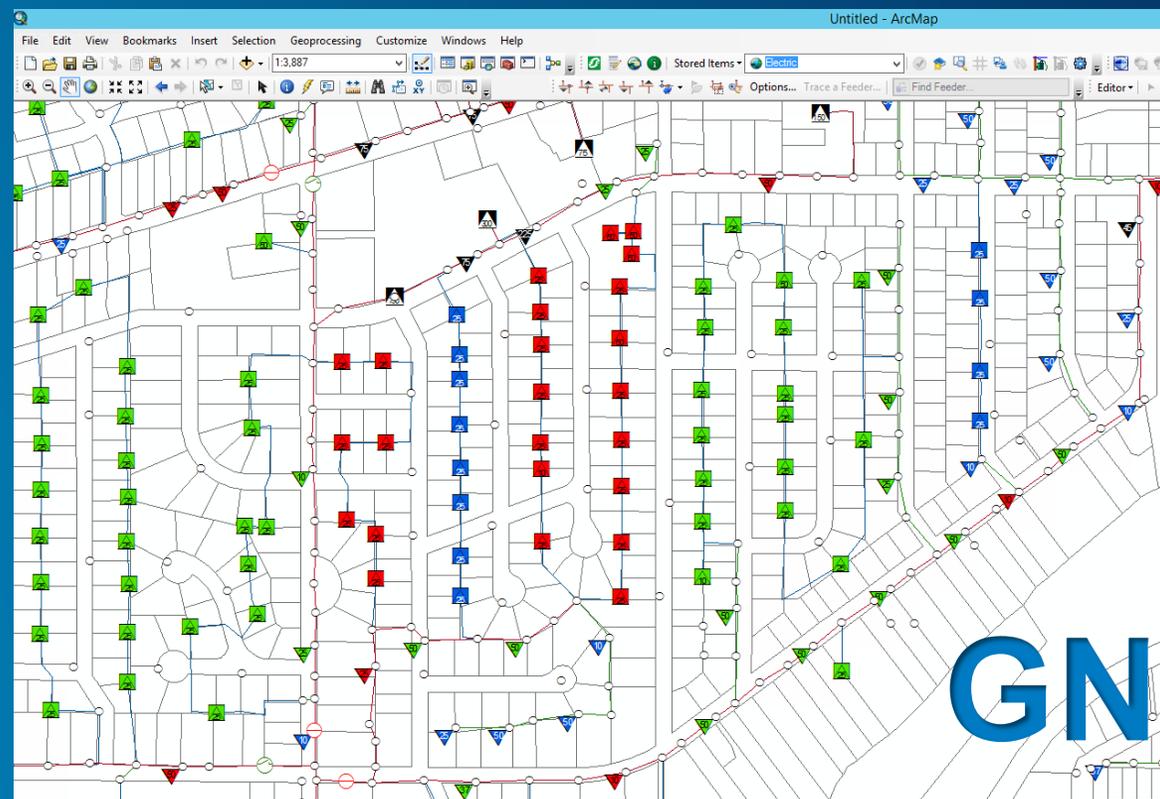

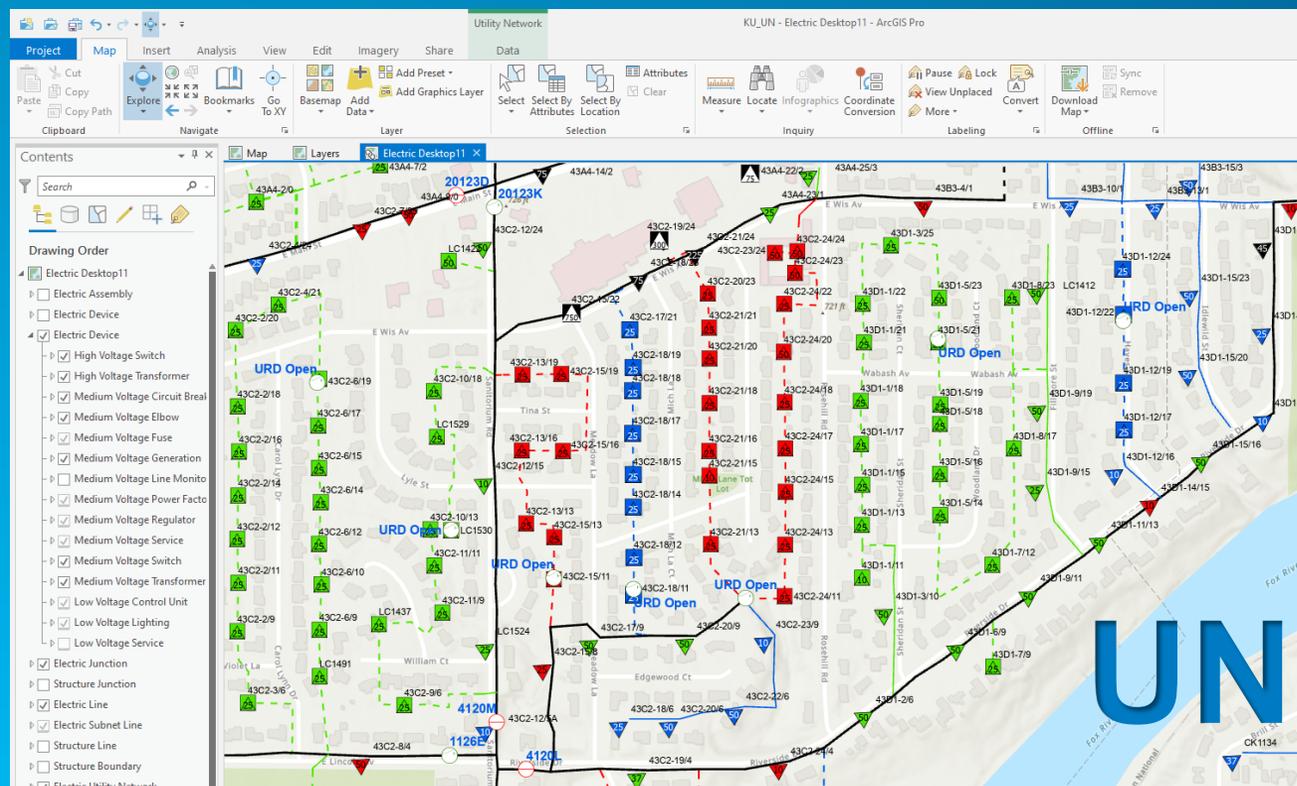

The screenshot shows the 'POWER Utility Network Data Modeling Tool' interface. The 'Validation' tab is active, displaying a table with the following columns: ConversionItemID, ConversionItemName, CountSourceRows, CountTargetRows, CountMissingIDs, and CountAttributeDifferences. The table lists various electrical components and their conversion counts. Two rows are highlighted in red: row 128 (CircuitSource) and row 131 (DynamicProtectiveDeviceBank).

ConversionItemID	ConversionItemName	CountSourceRows	CountTargetRows	CountMissingIDs	CountAttributeDifferences
130	CapacitorBank:1-Fixed Capacitor Bank ElectricDevice:Medium Voltage Power Factor Correcting:Overhead Three Phase Capacitor	2	2	0	0
129	CapacitorBank:2-Switched Capacitor Bank ElectricDevice:Medium Voltage Power Factor Correcting:Overhead Three Phase Capacitor	15	15	0	0
160	CapacitorUnit:1-Capacitor Unit ElectricDeviceUnit:Medium Voltage Power Factor Correcting:	51	51	0	0
207	CircuitSource:1-Circuit Source C_SubnetworkControllers:No Subtypes: High Voltage	3	3	0	-1
128	CircuitSource:1-Circuit Source C_SubnetworkControllers:Subnet Controller:	43	42	0	-1
185	ConductorInfo:1-Primary Overhead Conductor ElectricWireData:OH Medium Voltage:Overhead	12550	12550	0	0
186	ConductorInfo:2-Secondary Overhead Conductor ElectricWireData:OH Low Voltage:Overhead	12253	12253	0	0
201	ConductorInfo:3-Primary Underground Conductor ElectricWireData:UG Medium Voltage:Underground	6507	6507	0	0
188	ConductorInfo:4-Secondary Underground Conductor ElectricWireData:UG Low Voltage:Underground	16964	16964	0	0
198	ConduitSystem:1-Conduit StructureLine:Electric Medium Voltage Conduit:Conduit	2741	2741	0	0
199	ConduitSystem:2-Trench StructureLine:Electric Trench:Trench	39	39	0	0
206	DynamicProtectiveDeviceBank:1-Circuit Breaker ElectricDevice:High Voltage Switch:AC Circuit Breaker	3	3	0	0
131	DynamicProtectiveDeviceBank:1-Circuit Breaker ElectricDevice:Medium Voltage Circuit Breaker:Three Phase Circuit Breaker	69	69	0	69
134	DynamicProtectiveDeviceBank:2-Recloser ElectricDevice:Medium Voltage Switch:Overhead Three Phase Recloser	12	12	0	1

Moving Forward – Configuration & Integration

Maps - Kept same symbology in order to ease the transition on the users

Moving Forward – Configuration & Integration

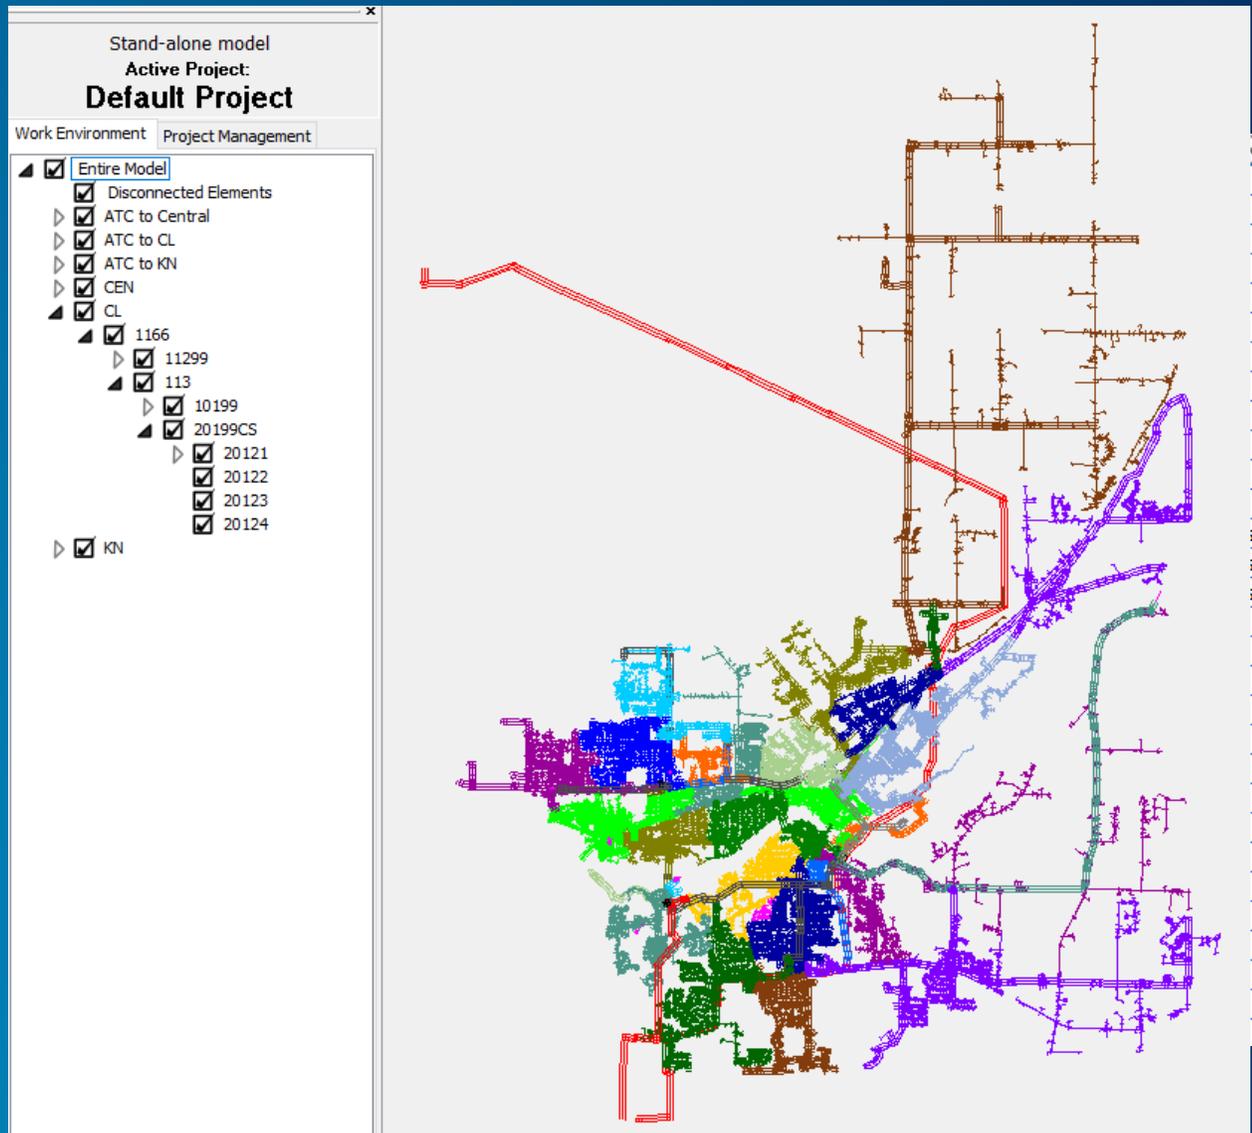

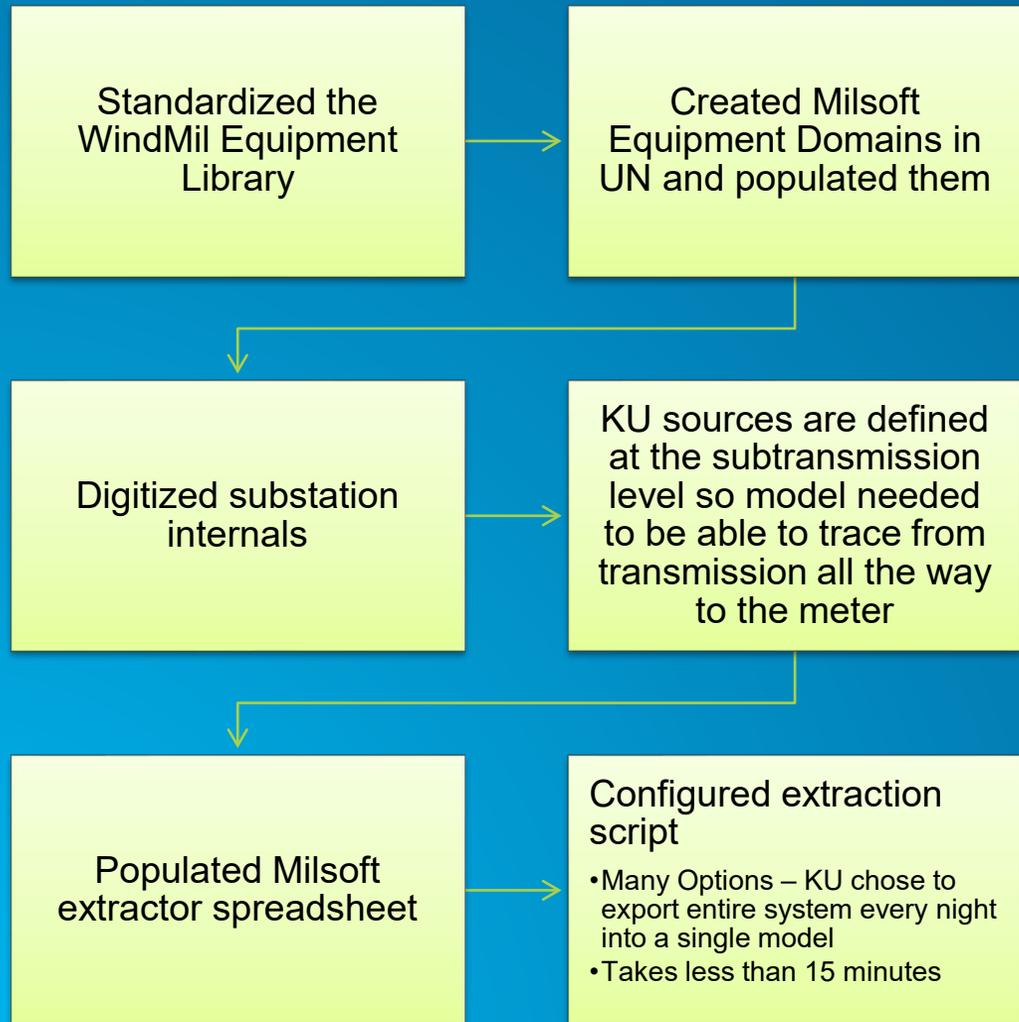

CIS Integration

- POWER developed script to import information from CIS on a nightly basis

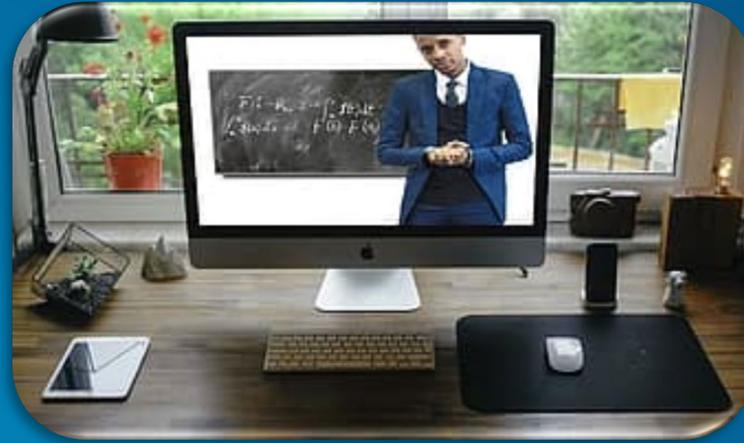

Mobile

- Used ArcGIS Explorer because KU standard for mobile devices are Windows Surface Tablets
 - Configured to support disconnected map viewing
 - Configured Markup capability
 - Needed some slight adjustments to symbology
 - Can view related records – just can't search them
 - Feature search not as good as Arc Reader

Moving Forward – Milsoft

Training

Completed various on-line courses from Esri

POWER provided 40 hours of remote Quick Start training including the following

Basic Utility Network Understanding

Editing Basics in the Utility Network

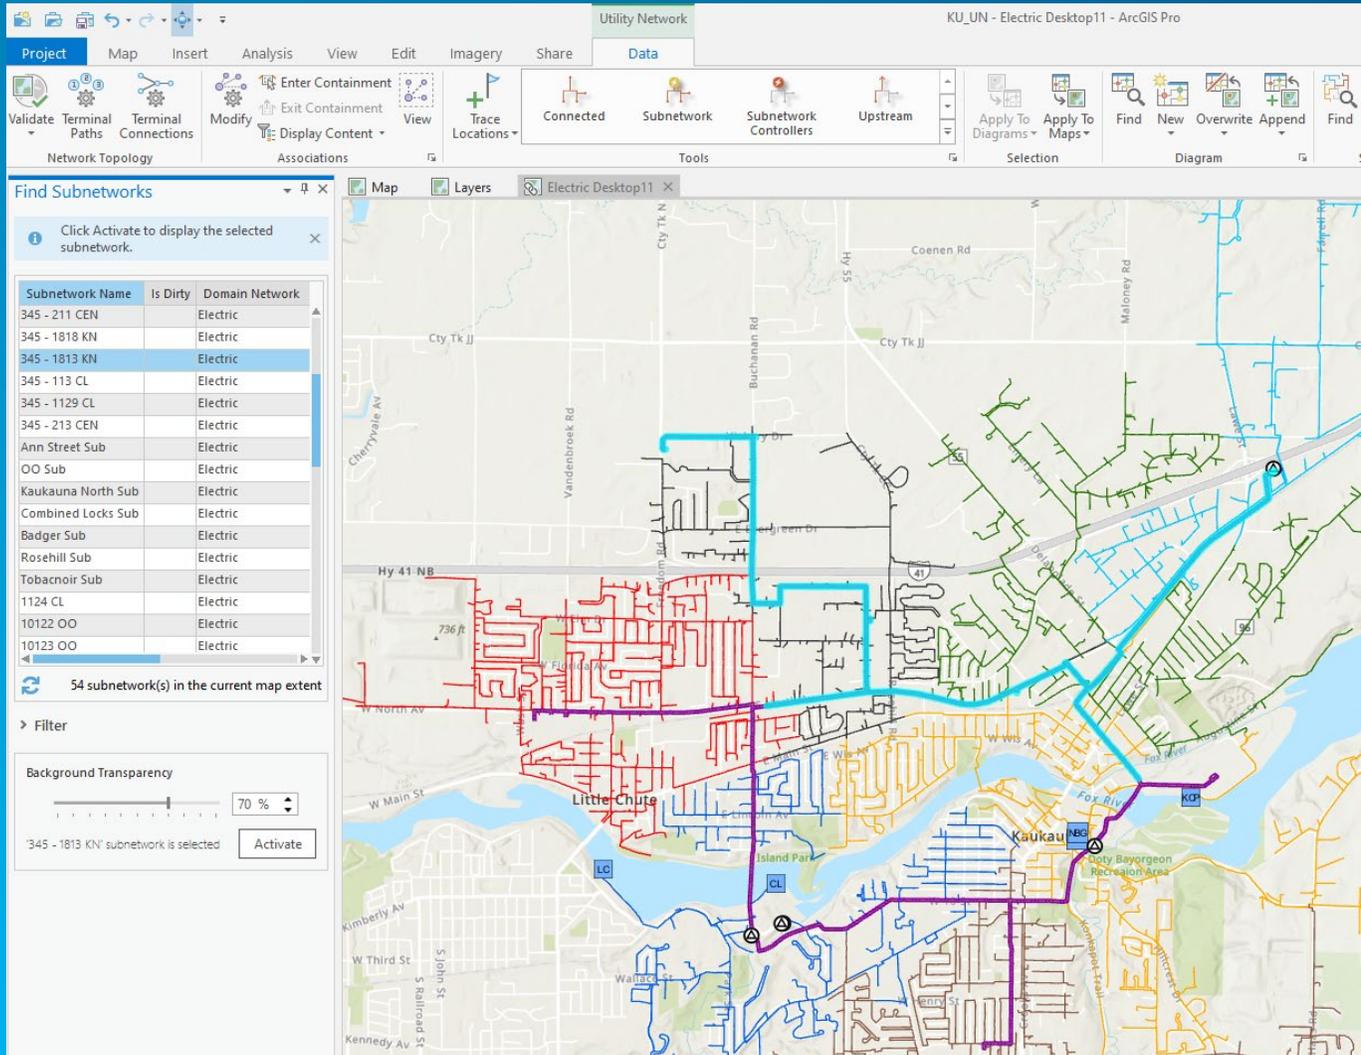

Performing QA/QC in the Utility Network

Utility Network Map Display Creation

Group Template Creation in Utility Network

ArcGIS Enterprise and Utility Network Administration

Go Live

Took final cut of data

Performed migration

Installed new data

Tested system

Went into production

Ran into a Esri bug that prohibited validation of dirty areas

Upgraded software

Installed data again

Tested system

Went into (and stayed) in production

Lessons Learned & Recommendations

Transition to the UN can be done!

Find a good consultant to partner with – it will be a journey

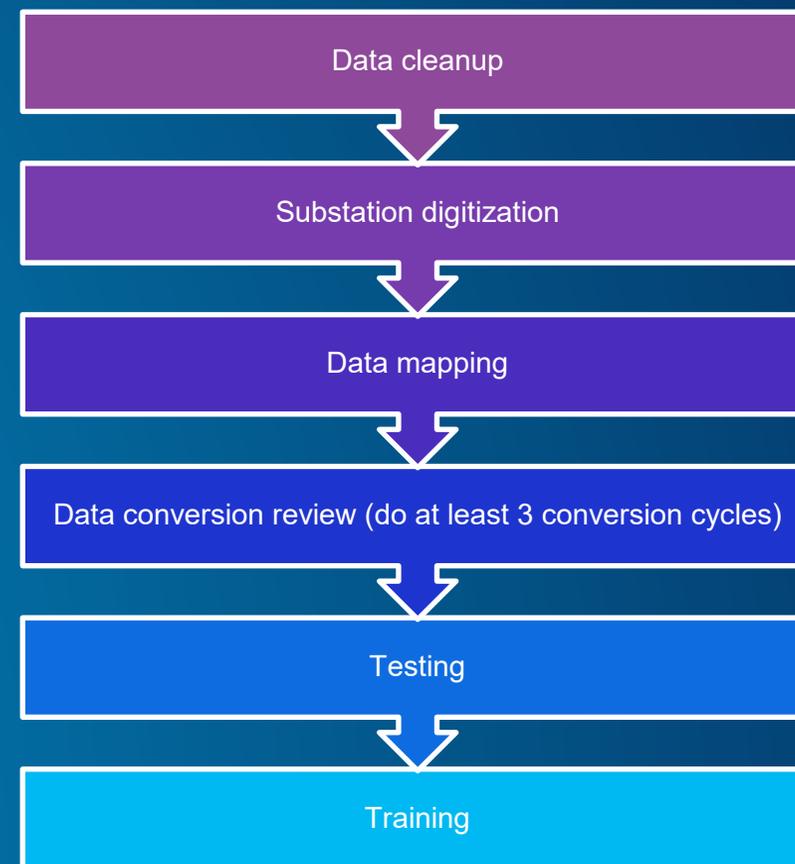

Start working with IT early to get the hardware required

Start working with Esri early to get the proper licensing

Allocate plenty of time for the following – it takes more effort than you think

Be open to the UN changes – don't try and build a new old GIS

Focus on getting it to work, then add improvements

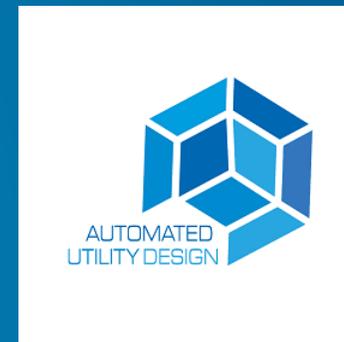

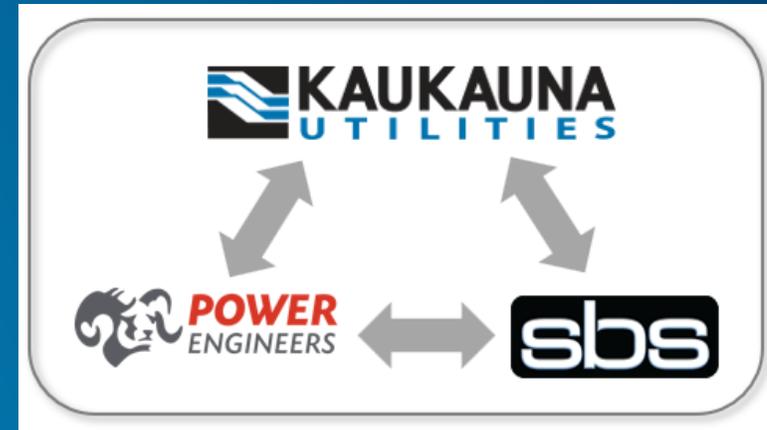

Next Steps

Working with POWER and Spatial Business Systems to implement AUD – an AutoCAD© based UN compatible graphical design tool

Extending ArcGIS Explorer to provide mobile water maps
